Ten Year Vision

2009 FARMS Report Appendix A

King County Agriculture Commission 10 Year Vision

Introduction

King County has some of the best conditions for farming in the country, if not the world: highly productive river bottom soils; a large population interested in local food production; a climate that provides temperatures for an almost year round growing season; and rains that leave relatively small irrigation requirements. Carnation Farm once had the world record for milk production; two Snoqualmie Valley families had the national record for milk production on individual farms. The City of Bellevue exists where there was once a bounty of strawberry yields produced by Japanese farmers before World War II. In 1940, King County produced the most lettuce of any county in the nation. This climate is what made Whidbey Island set the national record for bushels of wheat produced per acre. As one farmer has said: “With every inch of rain that drops here, I get an extra ton of corn and it doesn’t cost me a dime...”

King County has a remarkable history of public actions to preserve farmlands and markets and to encourage farming within the county. In the 1979 voters approved the Farmland Preservation Program (FPP) while at the same time fighting to preserve the Pike Place Market. The FPP has successfully preserved almost 13,000 acres of prized farmland for this and future generations. In 1985, the King County Comprehensive Plan designated approximately 40,000 acres as Agricultural Production Districts, where much of commercial farming occurs. The Current Use Taxation is another program that has proven to be an important way to ensure that farmland remains in agricultural use.

The Agriculture Commission was established in 1994 to support active oversight of these lands by the County, and to promote a healthy agricultural economy. Among its many accomplishments, the Commission played a critical role in establishing the Puget Sound Fresh and Farmlink programs and continues to find ways to enhance local markets and develop opportunities that encourage a new generation of farmers. Through these efforts, a good base of land has been preserved for farming.

But more work is needed. Good farmlands not preserved continue to be lost to new development, and farming can be difficult in a rapidly urbanizing county. While the urban area provides a thriving market potential, it also poses many threats to local agriculture. Major steps need to be taken to insure that the county’s efforts provide the basis for increasing local food production in a world where the benefits of local food supply are increasing on a daily basis.

Goals:

Overall goals

1. To preserve agricultural lands within King County's Agricultural Production Districts and Rural Areas; and
2. To promote and nurture the business of farming in King County for this and future generations.

10 year goals.

The Vision

More Farmers Farming

1. Promote Access to Farmland

How might we achieve the goal?

- Conduct an economic analysis of purchasing additional development rights on lands where development rights have already been acquired by the County to reduce sub dividing
- Draft criteria suggesting that applicants be asked to describe how farming will continue on their land for the foreseeable future
- Give farmers who agree to participate in the farm link/farm mentoring program, which matches new farmers with retiring farmers (described below), special consideration in the evaluation of the property
- Work on ways to keep FPP land in active farming, especially when FPP land changes hands.
- Include a sizable amount of funds to acquire additional development rights in King County in next major funding initiative for the purpose of acquiring more farmland.
- Utilize clustering, transfer of development rights, and density bonuses to encourage landowners to keep their lands in agricultural use
- Work on home size issues as related to affordability on Ag zoned land.

2. Support Intergenerational Transfer of Farmland and Ag Knowledge

How might we achieve the goal?

- Develop a partnership with FarmLink and other appropriate groups to find farmers for County owned land
- Link the FPP program and FarmLink more closely
-
- Increase support and funding for the FarmLink Program
- Develop a "mentoring" program which would provide an opportunity for experienced farmers to share their knowledge and resources with new farmers.
- Work with the existing high school and other vocational programs to create training programs for new farmers.

3. **Develop a demonstration farm (or several farms on smaller sites) to serve as testing sites for research and technical assistance on high intensity urban fringe farming. The farm(s) would also provide public education to teach citizens about farming.**

How might we achieve the goal?

- The public benefits could include: making land available to beginning farmers, skills training for beginning farmers, promotion and training of sustainable agricultural practices, public education about organic farming or other conservation practice

4. **Expand the existing tax incentive programs to provide further benefit to farmers**

How might we achieve the goal?

- Require that land (already or ASAP) be enrolled in Current Use Taxation (CUT) program to be eligible for the Farmland Preservation Program.
- Work with Assessor's office to develop a marketing program for CUT
- Work with the Assessor's Office in an advisory role to develop policies that improve agriculture activities.

The vision

Our Farmers will Have More Market Opportunities

1. **Develop new food markets and using Puget Sound Fresh as a tool**

How might we achieve the goal?

- Increase farmers markets and CSAs as needed
- Develop cooperatives for small farmers to access institutions
- Develop scale appropriate slaughter facilities for livestock owners
- Facilitate emerging ethnic specialty markets

2. **Develop secondary markets for added farm revenue:**

How might we achieve the goal?

- Biofuels
- Manure
- Agro-tourism

3. **Expand partnerships with other counties in the Puget Sound Region**

How might we achieve the goal?

- Focus on Farming with Snohomish County
- Puget Sound meat project
- Puget Sound Fresh

4. **Continue to provide education related to agriculture**

How might we achieve the goal?

- Continue to work with the Cooperative Extension Service to make sure King County farmers have dedicated agents for horticulture and livestock, and sufficient resources from a statewide dairy team
- Fund an endowment that would provide grants to conduct specific research, technical assistance and education programs that would benefit local farmers: energy efficiency, waste stream markets, ethnic products, etc...

The Vision

Our Regulations will be more Farm and Food Friendly

1. Continue to look at regulations

How might we achieve the goal?

- Continue regulatory reform, with a particular emphasis on the cost of building permit fees, the time it takes to acquire building permits for farm-related structures, and drainage maintenance.
- Continue to streamline permits and coordinate regulations among local, state and federal agencies.
- Allow temporary housing for farm workers.
- Continue to review proposed policies and regulations prior to adoption, and existing policies and regulations that have a substantial impact on farmers
- Analyze how upslope regulations and innovative technologies could reduce field inundation and improve drainage.
- Enhance the Agricultural Ditch Assistance Program (ADAP, aka, Fish and Ditch) to reduce costs and lead times.

2. Continue to identify additional ways in which the zoning code could be amended to preserve the integrity of the farmland while allowing greater flexibility to farmers in developing commercial uses that support agricultural production.

How might we achieve the goal?

- Continue to develop more flexible ways to enhance on site sales of agricultural products.

3. Expand services that help farmers receive better, more efficient service from King County.

How might we achieve the goal?

- Continue problem solving, workshops and outreach by Ag Permit Team
- Expand farmbudsman services.
- Provide direct access to KCD farm planners...

4. Assistance in completing permit processes at the local, state, and federal level

How might we achieve the goal?

- Information about available tax incentive programs;
- Assistance in working with the Conservation District to complete farm plans.
- Provide information about available grants, loans, or other forms of governmental assistance.
- Provide information about regulatory requirements.
- Cooperate with other regulatory agencies to improve and streamline regulations

5. More closely monitor the activities in the Agricultural Production Districts

How might we achieve the goal?

- Increase GIS mapping of activities and uses
- Increase communications with land owners
- Work with other agencies to coordinate efforts to encourage more farming in the APDs

The Vision

The Threats to Agriculture will be Diminished

1. Look for ways to adapt to and help reduce the effects of climate change.

How might we achieve the goal?

- Develop innovative ways to increase the water supply (Water storage ponds, reclaimed water etc.) for irrigation.
- Improve drainage systems through the APDs
- Develop growing techniques that are more adaptable to climate variations (i.e. greenhouses)
- Improve programs that allow farmers to protect themselves from wildfires

2. Develop a regional effort to reduce the impacts of growth

How might we achieve the goal?

- Educate cities and agencies on the importance of agriculture
- Encourage participation of Ag interests when projects such as road expansions are being planned
- Encourage participation of Ag interests on planning boards
- Partner with neighboring counties and the State to coordinate policies and regulations
- The remaining prime farmlands in the Urban Growth Area should be evaluated for their potential value for food production. Those areas that could continue to perform small-scale agricultural activities, such as market gardens, livestock operations, community pea patches, or as educational or research farms, shall be zoned for agriculture.
- Create Right To Farm legislation

3. Expand a regional effort to enhance Ag

How might we achieve the goal?

- Focus on Farming
- Develop programs with NW Ag Business Center
- Continue to support Puget Sound Fresh

4. Clearly define what Agriculture is

How might we achieve the goal?

- With other counties, organizations and the State to develop a vision of what Ag is.
- Work with local farmers to define Ag uses

SWOT Analysis

<u>Strengths</u>	<u>Weaknesses</u>	<u>Opportunities</u>	<u>Threats</u>
Easy access to a large market	Too much land underutilized	Increased market access (more CSAs, farmers markets)	Land speculation growth of cities
Lots of direct marketing opportunities	Too much wet land; Flooding	Developing new products (value added)	Lack of capital for beginning growers
Mild climate allows for a long growing season	Lack of infrastructure	Selling to institutions (schools, restaurants etc.)	High cost of land
Diverse crop and animal production	Regulatory issues	Agritourisim	Availability of water for irrigation
Best soil in the country	Traffic issues	Educational opportunities (school tours)	Conversion of ag land to non ag uses
Lots of technical assistance	Lack of labor	Grass fed meats	<u>Mansions?</u>
There is still enough land to provide a significant amount of food for County residents	No affordable worker housing	Cideries	<u>Horses?</u>
Ability to charge what the product is worth	More expensive to get into farming	Ability to address food safety concerns (putting a face on food)	Urban Sprawl
Selling directly to the consumer	Lots of small parcels	Sheep and goats for ethnic markets	Flooding
Good grass growing	Funding programs (Farmlink)	Biofuels?	Large scale restoration projects?
Puget Sound Fresh	Lack of understanding about Ag in the County (many people think there is no Ag; or more than there is; or that we have large exports, etc)	Climate change	Transportation projects.
Strong consumer interest in local food			Obstacles to Drainage Mitigation Projects Climate change

Farmers' Perceptions of Farming in King County:

The Challenges, Industry Trends and Needed Resources and Services

Prepared by Kara E. Martin

Department of Urban Design and Planning, University of Washington

May 2009

Ag • ri • cul • ture (noun)

[Date: 15th century; Etymology: Middle English, from Middle French, from Latin *agricultura*, from *ager* field + *cultura* cultivation]:

The science, art, or practice of cultivating the soil, producing crops, and raising livestock and in varying degrees the preparation and marketing of the resulting products.

Executive Summary

On July 1, 2008 the King County Council adopted Ordinance 16172 calling for a study be conducted “to address the future of agriculture” in the County’s zoned agriculture production districts (APDs). The King County Agriculture Commission with the aid of the King County Ag Programs staff within the Department of Natural Resources and Parks (DNRP) was charged with the task of completing this report dubbed the *FARMS Report* or *Future of Agriculture: Realize Meaningful Solutions Report* by January 1, 2010. The Ordinance 16172 also required the farming community’s input to be included in the study’s planning process. As a result, the County held five public meetings and conducted a mail-in and online survey to collect the input of local farmers. This professional project of a University of Washington graduate student is a contribution to the larger *FARMS Report*. This report focuses specifically on identifying the farmers’ perceptions of farming in King County based on the collected feedback.

A combination of quantitative and qualitative analysis of the farmer’s survey responses and public meeting comments are categorized into three general themes: (1) major challenges farmers confront, (2) emerging trends in farming and (3) needed resources and services to keep farming viable in the county. The themes identified reflect the perceptions of farmers through the compilation of comments from 89 surveys and over 170 public meeting participants. A comparison of the findings to Washington State’s *The Future of Farming: Strategic Plan for Washington Agriculture 2020 and Beyond* (2009) and King County’s *Forest and Farms Report* (1996) demonstrate that the barriers farmers identified are not longstanding and necessarily unique to King County. The report also reviews commonly used agriculture protection regulations and policies in United States and takes a historical look at the rural landscape in King County and agriculture programming implemented in King County over the past several decades. The report findings are solely based on the farmers’ perceptions which are not necessarily in alignment with the general public’s views on agriculture. Their views and opinions are at times contrary to other county priorities. For example, some farmers expressed deep

frustration with environmental regulations which they believe are an infringement on their property rights and impede their operations. However, agriculture is a major contributor to environmental issues (i.e. poor water quality, polluted soils, habitat destruction, etc.) and County, State and Federal regulations have been established to protect this public interest. Further compounding the issue, there is also a paradox within themes identified. While farmers are concerned with the protection of property rights, they at the same time feel the county should be more invested in agriculture through providing financial assistance and other resources for farmers. Herein lies the challenge of striking a balance between justifying public support for agriculture and protecting the private business interests of farmers. This report offers an opportunity to expand the discussion and debate about the future of agriculture in King County.

In the face of increasing budgetary constraints, the County has begun to question their role in agriculture protection programming. In the fall of 2008, staff supporting the King County Ag programs was slated to be cut from the County's annual budget. Fortunately, the Agriculture Commission, representatives of organizations and agencies greatly impacted by the decision (i.e. neighborhood farmers' markets) and residents, both urban and rural, spoke out against the cut at a series of public hearings. As the County continues to determine its future role in agriculture, it should consider the challenges farmers confront as described in this report. Farmers' ability to comprehend the intricacies of the local regulations and maneuver through the permitting system are dependent on the support and assistance the local government provides. Conversely, as a regulatory body, the County itself needs to increase its understanding of farming operations and related land use needs. For example, agricultural commercial buildings are used differently than commercial buildings in urban settings and thus universal codes, largely tailored for urban uses, can be a hindrance to farming operations and their overall economic viability. Without the appropriate staff and programming focused on agriculture *within* the local government, these needs will easily be overlooked. Over thirty years ago the County recognized the economic and cultural significance of its agriculture sector and sought to protect it through what is now a comprehensive program. To remove its support now

would be to the detriment of not only the farmers as well as the urban population but also farming communities in metropolitan areas throughout the country who turn to King County as a leader and pioneer of agriculture protection.

Chapter 1: Introduction

For over forty years, King County and its residents have recognized the importance of keeping farming viable in the county.¹ With public support, local planning and policymaking has worked to protect some of the most fertile lands for agriculture from being developed and has promoted the business of farming. However, due to an intricate web of regulatory control at multiple governmental levels (i.e. federal, state and county), financial constraints, encroaching development from the urban fringe, and rising environmental concerns, King County farmers are challenged today to remain in the agriculture industry. On July 1, 2008, the King County Council adopted Ordinance 16172. The resulting report will address the viability of farming in the county and the continued protection of farmland. Section 9 of the ordinance provides the details of this request:

A. The department of natural resources and parks and the King County agriculture commission shall convene a planning process to address the future of agriculture in the agricultural production districts ("APDs"). Participants in this planning process should include representatives from the department of development and environmental services, the King Conservation District and property owners representing a diversity of interests in the APD.

B. By no later than January 1, 2010, the department and the agriculture commission shall provide the council a report relating to the future of agriculture within the APDs, as well as recommendations for legislation regarding the allowed size of agricultural accessory buildings.

The County's Agriculture Commission, with the aid of the King County Ag Programs staff within the Department of Natural Resources and Parks (DNRP), is charged with the task of completing this report dubbed the *FARMS Report* or *Future of Agriculture: Realize Meaningful Solutions Report*. The Agriculture Division's FARMS study team has identified six main questions to be addressed in the report. The questions are:

1. What specific agricultural activities will most likely contribute to the economic stability of the county's farm sector?

¹ The terms "County" and "county" are frequently used throughout this report. "County" refers to the government entity and department and services provided by the jurisdiction; "county" refers to the general public, providing a geographic boundary.

2. How can we continue to preserve the agricultural lands within the APDs and rural areas in the future?
3. How can we nurture and promote the business of farming for the future?
4. What should be the allowed size of an “agricultural accessory building?”
5. What is the role of King County and other agencies (i.e. King Conservation District) in supporting farming in the future?
6. What are the potential funding sources, and how might these and existing funding sources be allocated to support agriculture in the future?

Recognizing the report’s potential impact on the farming community, the county agriculture commission and staff have sought the opinions of the farming community through a series of public meetings and a questionnaire. As a component of the larger *FARMS Report*, this report provides an analysis of the primary data collected from these two survey instruments.

This report’s methodology (*Chapter 3*) is a combination of quantitative and qualitative analysis of farmers’ feedback. Through compiling the open-ended comments collected from the surveys and noting frequencies, the farmers’ comments are broken into three general themes: (1) major concerns and challenges, (2) emerging trends or adaptations in the farming industry and (3) needed resources and services. The findings (*Chapter 4*) provide a synopsis of each theme identified and are solely representative of the farmers’ feedback. A discussion (*Chapter 5*) follows that draws comparison between the report’s findings to two studies of similar focus: Washington State’s *The Future of Farming: Strategic Plan for Washington Agriculture 2020 and Beyond* (2009) and King County’s *Forest and Farms Report* (1996).

The analysis of farmers’ perceptions is complemented by background research (*Chapter 2*) in an effort to provide context to the identified themes. This context is developed through constructing a timeline of King County’s role in preserving farming and farmland and describing current land use and farm operation conditions. Additionally, this section includes a discussion of farmland preservation efforts at the local level throughout the United States.

The findings in this report are intended to provide the King County Council, the Agriculture Commission, the Department of Natural Resources and other county departments (e.g. Department of Development and Environmental Services) and non-governmental agencies (e.g. King Conservation District) with a critical look at the farmers' perspective of the future of the agriculture industry in the county. The information can assist the County as they determine what the local government's potential role is in preserving farms and farming.

Chapter 2: Background

This chapter reviews commonly used agriculture protection regulations and policies in United States and takes a historical look at the rural landscape in King County and agriculture programming implemented in King County over the past several decades. This background research provides the context for the findings presented later in the report. The research familiarized the author with King County's past and current agriculture sector which was critical in analyzing the farmers' survey and public meeting comments.

While King County, Washington is more known for its thriving metropolitan areas and industrial sector, agriculture has also played a significant role in its 150 year history. Founded in 1852, King County saw little agriculture activity until the arrival of white settlers. By 1946, the county contained over 6,400 acres of farmland (Washington State, 1956). Primarily serving the local growing metropolitan population, the county had numerous dairy cooperatives as well as vegetable and fruit producers. During World War II, war-supporting industries such as Boeing flourished, and the county saw a population increase from 505,000 in 1940 to 733,000 in 1950. This 45 percent increase was the beginning of population growth that would cause remarkable changes to today's rural landscape.

Along with several other metropolitan counties (i.e. Carroll County, Maryland) throughout the United States, King County turned to land use planning as a mechanism to protect farmland from being further developed as early as the 1960s. Before providing a historical account of King County's agriculture protection efforts and existing farmland conditions, a discussion of the land use controls designed to protect farming is first presented.

Overview of Agriculture Protection Programming

In addition to development pressure and rising land values common in the past century, farmers near the urban fringe face a unique set of challenges in contrast to farms not near a metropolitan area. The "urban fringe" is part of a metropolitan county or region that is sparsely developed (less than two houses an acre) through low-density

development of houses, road, commercial structures and utility. This landscape often caters to urban users, such individuals working in the city while “living in the country,” while providing the impetus for further growth (Heimlich and Anderson, 2001, p. 2). The close proximity to concentrated urban land uses (i.e. 10-40 miles) and the blurred line between urban and rural in which there is a mix of nonfarm neighbors dispersed in large open spaces predominantly used for agriculture purposes create conflicts between the different land users. Daniels and Bowers note several problems that are well-known to farming communities near the urban fringe across the country. They are as follows (1997, p. 5):

1. Developers bid up land prices beyond what farmers can afford and tempt farmers to sell their land for development.
2. The greater number of people living in or next to the country side heightens the risk of confrontation between farmers and non farmers.
3. Complaints increase from nonfarm neighbors about manure smells, chemical sprays, noise, dust, and slow-moving farm machinery on commuter roads.
4. Farmers suffer crop and livestock loss from trespass, vandalism, and dog attacks. Stormwater runoff from housing developments washes across farmland, causing erosion, and competition for water supplies increases.
5. As farmers become more of a minority in their communities, nuisance ordinances may be passed, restricting farming practices and in effect making farming too difficult to continue.
6. As farms are developed, farm support businesses are pushed out. Remaining farmers stop investing in their farms as they expect to sell their land for development in the near future.
7. Open space becomes harder to find, the local economy changes, and rural character fades.

What is apparent in this set of problems is that farming near the urban fringe is a two-pronged issue. First, as described in the previous section, the farmland itself is under threat of being converted into non-farm uses, as evident from the declining supply of farmland. Second, agriculture as a business is threatened as farming communities compete with urban interests and operations became less and less profitable. The public meeting comments and survey responses collected for this study reveal that the problems outlined by Daniels and Bowers are challenging King County farmers today. For instance, farmers are concerned about increasingly high costs of land, incompatible land uses nearby, loss of

infrastructure and businesses supporting farming, and low priority of rural interests and needs in a predominantly urban county (*see Chapter 4*).

In the wake of the declining amount of prime farmland in urban areas, local governments have designed and implemented a range of land use tools and policies to protect farmland as well as lessen the impact of urbanization on farming operations. Tools such as agriculture zoning, differential tax assessment programs, transfer and purchase of development rights (TDR/PDR), and right-to-farm laws first came into use in the 1970s. Table 2 provides a description of the various tools utilized by local governments to protect farmland and also notes which tools are utilized in King County. Today, these tools are have become commonplace for metropolitan farming areas across the nation working to protect their agriculture sector.

Table 1: Land Use Tools for Agriculture Protection²

Tool	Description	King County
Agriculture Districts	A voluntary formation of a district by landowners. Landowners sign a petition to enroll land in a district for a designated amount of time. Landowners in the district may receive incentives such as tax relief, exemption from local nuisance ordinances and limitation of extension of public services (e.g. sewer). No restrictions are placed on land uses.	Not applied.
Agriculture Zoning	Zoning designed specifically to limit development and promote agriculture uses. Regulates minimum lot sizes, permitted land uses, setback and subdivision requirements. Definition of agriculture uses varies according to each zoning ordinance.	In 1985, the King County Comprehensive Plan designated approximately 40,000 acres as “agriculture production districts.” The five districts are managed within the County’s zoning ordinance.
Comprehensive Planning	Plan guiding a community’s long-term growth. The goals and objectives can include agriculture protection measures.	Mandated by Washington State’s Growth Management Act, the King County Comprehensive Plan includes a rural element to conserve and enhance the county’s rural communities and resource lands including agriculture.
Conservation Easement	A voluntary legal document that restricts specified activities to protect open space uses such as farming. The easement is perpetual and runs with the land. Easements are granted by property owner to a conservation agency or government agency.	Four land trusts exist in King County. They include: Cascade Land Conservancy, PCC Farmland Trust, Save Habitat and Diversity of Wetlands Organization, Vashon-Maury Island Land Trust

² Descriptions written by author. Sources: Coughlin, 1981; Daniels and Bowers, 1997; Toner, 1978.

Tool	Description	King County
Differential Assessment	Property tax breaks provided wherein farmland is valued for its current use rather than highest and best use. The difference in assessed value between the highest and best use and the agriculture use determines the tax break. There are three types of differential assessment: pure preferential, deferred taxation and restrictive agreements.	Washington State adopted the Open Space Taxation Act in 1970 allowing the County Assessor to value property at current use.
Purchase of Development Rights (PDR)	Voluntary sale of a piece of property's development rights in which the development rights are designated to a receiving area. The land sold from the PDRs is restricted to agriculture uses.	County established the Farm Preservation Program in 1979 through a \$50 million voter-approved bond. 95% of the property must remain undeveloped. Over 13,200 acres have been protected to date.
Right-to-Farm Legislation	Legal protection for farmers from nuisance suits for standard farming practices such as odors, noise and slow machinery on roads.	There has been effort to adopt a county right-to-farm law. Other Washington counties (i.e. Snohomish) have such ordinances.
Transfer of Development Rights (TDR)	Voluntary sale of a piece of property's development rights to a government agency or land trust. Land is restricted to agriculture uses.	Due to the locally supported PDR program, TDRs have not been utilized for farmland protection.

Widely adopted by metropolitan areas throughout the country, these land use tools vary from being incentive-based through tools encouraging producers to stay in the business of farming (i.e. tax breaks) to regulatory-based tools limiting and controlling development. Though some tools, such as agriculture zoning, are more commonly used than others, it is critical to note that no single tool alone can successfully protect the agriculture sector. Daniels and Bowers emphasize it is, a *package* of tools and policies designed to address the specific needs of the community that increases the success of an agriculture protection program (p. 103). Furthermore, an integrated approach that recognizes the competing and supporting interests within a metropolitan region, such as ensuring housing and employment opportunities, providing utilities and public services, protecting environmentally sensitive areas and remaining fiscally secure, contribute to a program's success (Coughlin, 1981, p. 26; Toner, 1978, p. 4).

Without the support of the general public and local officials, farmland protection programming derives little success for the farmer. While protecting farmland and

agriculture activities are the primary goals of these programs, secondary objectives such as protecting natural habitats, preserving agrarian heritage and providing recreational opportunities also play a role in generating the much-needed political will for successful agriculture protection programming. A host of studies analyzing the effectiveness of agriculture preservation programming note the importance of considering the array of private and public benefits in program development (Deaton et. al., 2003; Duke and Aull-Hyde, 2002; Lynch and Musser, 2001; Kline and Wichelns, 1996). The impact of secondary objectives on farming is evident in this study from the public meeting comments and survey responses. Farmers noted emerging trends in their operations to meet local market demands such as developing “agriculture tourism” opportunities and adopting conservation management practices such as salmon recovery efforts (*see Chapter 4*). Though the list of tools shown in Table 1 were first developed by local governments over thirty years ago and still remain the primary tools used farmland protection today, planning practitioners and scholars are continually evaluating their effectiveness and seeking ways to meet the range of goals while maximizing the public and private benefits.

King County’s Changing Rural Landscape

The first half of the twentieth century saw a continual growth in King County’s agriculture land base. Land originally cleared for logging purposes was sold off in 10-, 20- and 40- acre plots to farmers that primarily produced for the local population. Land that was cultivated for farmland was primarily located near the new settlements, due to the accessibility, and in valleys where the soil quality was most fertile and required little irrigation. By 1945, King County reached a peak of 6,495 farms cultivating 165,635 acres (U.S. Census of Agriculture); however, by 1954, the county lost nearly 20,000 acres to non-agriculture uses. Referring to the nine-year decline, Washington State Department of Agriculture reported “... area in farms and number of farms have been decreasing. This indicates some abandonment of farming for other employment, and the increasing use of some land for residences and industrial purposes. In recent years considerable farmland in the Duwamish, Green and Sammamish Valleys has been taken out of agriculture” (1956, p.

28). According to the Census of Agriculture, the amount of farmland continued to decline over the next few decades. The post-WWII boom in population led to two-thirds of farmland being consumed by sprawling development within a thirty-year period (Calthorpe and Fulton, 2001, p. 160). During this severe loss in farmland from 1945 to 1974, King County’s population more than doubled. In order to accommodate the growth, existing municipalities expanded and 15 new suburban communities incorporated (Reinartz, 2002, p. 9).

Figure 1 depicts the county’s increase and decrease of farmland over the past century.³

Figure 1

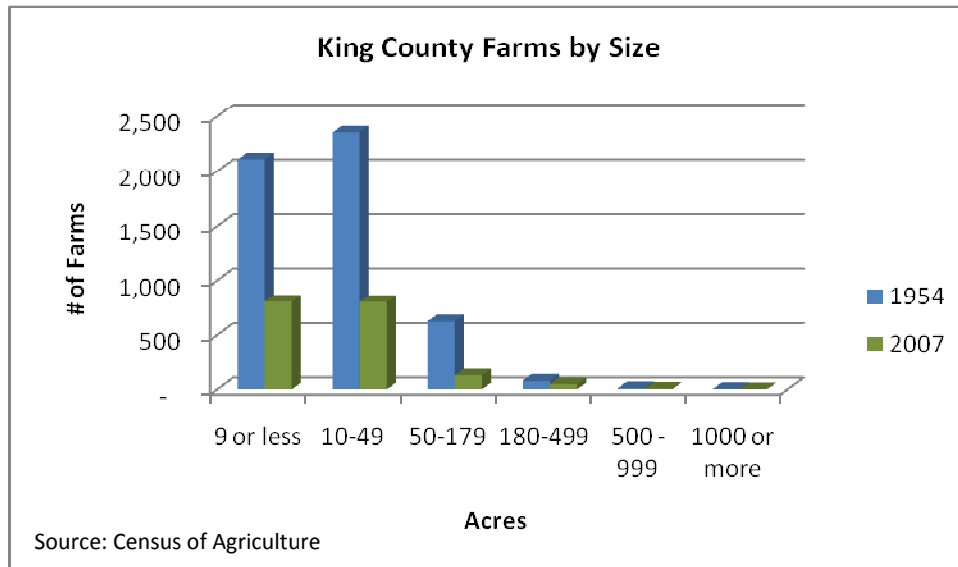

In 1945, agriculture land accounted for 12 percent of the county’s land mass. As of 2007, it has been reduced to four percent. Figure 2 provides a comparison of the number

³ The Census of Agriculture has changed the definition of a “farm” nine times since 1850 when it was first established. The number of farms and acreage in farms has varied as a result. The current definition, last revised in 1974, is “a farm is any place from which \$1,000 or more of agricultural products were produced and sold, or normally would have been sold, during the census year” (USDA, 2007, p. vii). However, the Census also states: “this includes farms with sales of less than \$1,000 but having the potential for sales of \$1,000 or more. Some of these farms had no sales in the census year. It provides information on all report form items for farms that normally would be expected to sell agricultural products of \$1,000 or more.” In general, data prior to 1974 is not fully comparable to 1969 and earlier census years.

farms according to their size between 1954 and 2007 and shows that the loss severely impacted smaller size farms that accounted for a majority of the farms. Overall, there has been a 65 percent decrease in the number of acres farmed since the mid-1940s.

Figure 2

King County recognized early on the detrimental effect sprawl was having on the county’s stock of agriculture land and began implementing farmland protection measures in the 1960s to thwart sprawl from consuming more land. These efforts are evident between 1974 and 2007 when the amount of farmland declined by only 14 percent—the portion of county land used for agriculture purposes remained at four percent for over thirty years (see Table 2).

Table 2: Historical Trends of Acres Farmed and Number of Farms

Farms	1945	1954	1974	2007
# of farms	6,495	5,181	1,022	1,790
Acres of farmland	165,635	145,111	51,368	49,285
% of total county land	12%	11%	4%	4%

King County's Agriculture Protection Programming

The 1960s saw the first formal efforts to protect farming in King County. The *King County Comprehensive Plan* in 1964 by identified areas for continued agriculture use by stating the goal of “protection of certain agricultural flood-plain, forest and mineral resource areas from urban type development” (p. II-4). Soon to follow, in 1965 the Puget Sound Governmental Conference (PSGC) formed through electing officials and the adoption of a regional comprehensive plan that included four policies concerning preservation of agriculture. Providing a springboard for farmland preservation programming at the local government level, the policies focused on promoting local governments to adopt agriculture zoning, endorsement of a current use taxation program and establishing guidelines for preserving a supply of farmland based on soil quality and other conditions appropriate for agriculture.

Over the next ten years several studies were conducted at the regional and county level to evaluate the land use and economic conditions in regard to agriculture. The first of those studies was published in 1974 by PSGC; the *Regional Agriculture, Land Use Technical Study* focused on farming conditions and issues in King, Kitsap, Pierce and Snohomish counties. Examining the regional costs and benefits of agriculture and what means are necessary to keep agriculture viable, this early study's purpose resembles many of the similar concerns that today's *FARMS Report* intends to address. Additionally—and perhaps more importantly—the study highlights that, in order for the agriculture sector to remain viable, successful programming includes a two-pronged approach: the preservation of farmland and the promotion of agriculture activities. According to the study:

...the maintenance of agriculture involves two separate endeavors: the maintenance of a land base and the use of that land base. The preservation of prime agricultural land without promoting agricultural use will result in extensive tracts of idle, unproductive land. Conversely, the promotion of agricultural activity would be a pointless gesture without an adequate land base for the activity.

(PSGC, p. 73)

The interest of preserving farmland was not solely government interest. Through the rise of public concern, the King County Council adopted a series of ordinances and motions by the King County Council calling for further protection measures. They include:

- Ordinance 1096 to establish a policy that “Class II and III soils having agricultural potential and other classified or unclassified land presently being farmed shall be reserved for current and anticipated needs” (1/10/1972)
- Ordinance 1839 “to preserve prime agricultural lands and significant other farmlands in the open space system” by setting criteria for preservation and implementation policies (11/05/1973)
- Motion 2251 to establish a moratorium on the further development of county agriculture land (12/22/1975)
- Motion 2252 for the “development of policy and programs which protect King County agricultural lands” (12/22/1975)
- Ordinance 3064 establishing eight agricultural districts in which the approval of permit applications, new sewer connections and public projects did not adversely affect agriculture in the districts (1/31/1977)
- Ordinance 4341 calls for elections to authorize the “issuance of general obligation bonds” for the acquisition of development rights of farmland meeting the County’s eligibility requirements (6/18/1979)

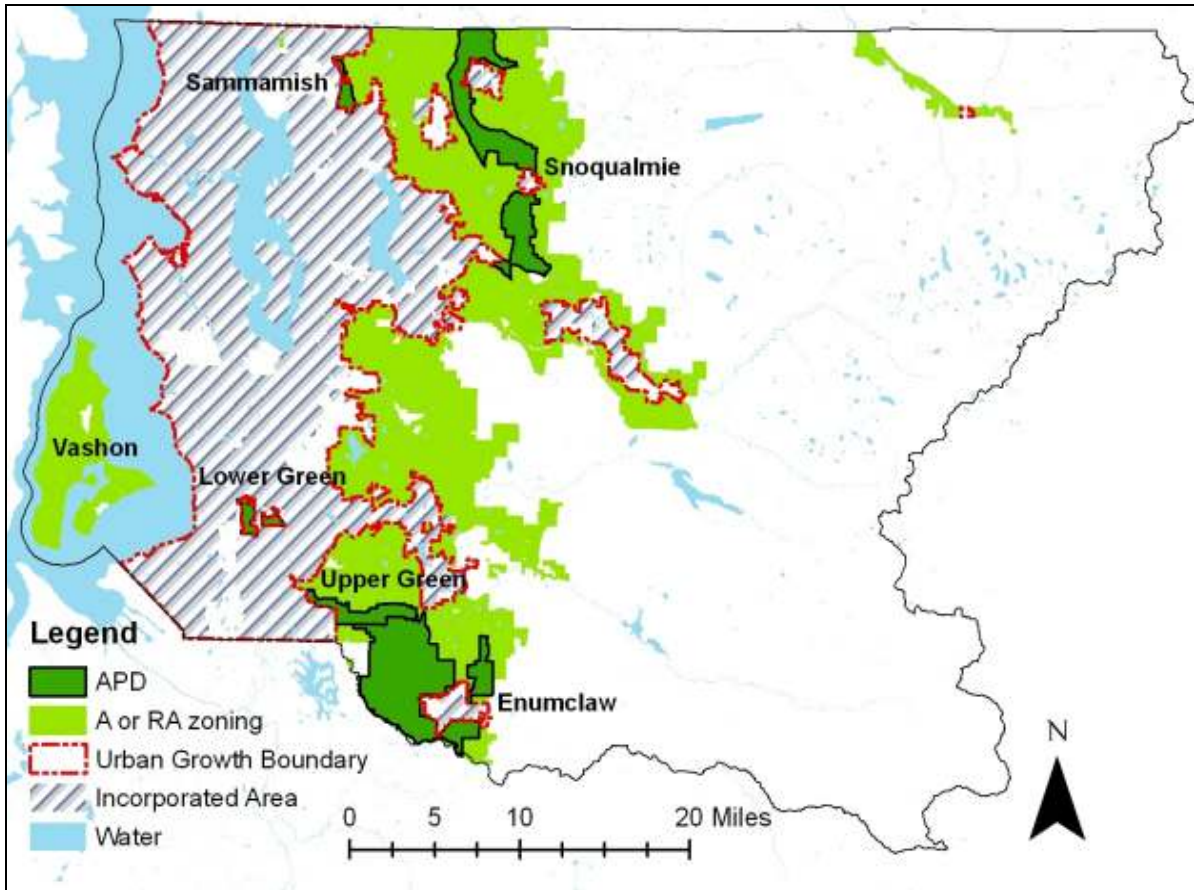

As a result of increasing public and government interest, the County’s Office of Agriculture was directed to research, develop and implement programming to address the problems confronting farmers. For example, Motion 2252 prompted the Department of Planning and Community Development to conduct the *King County Agriculture Study: Economic Factors Affecting King County Agriculture Production* (1976); the study provides extension documentation of the economic conditions and trends in agriculture. Soon to follow was the *Purchase of Development Rights to Retain Agricultural Lands: An Economic Study* conducted during the ordinance 2251’s moratorium on development, informing the County to consider placing a bond issue in support of a PDR program (1978). As a result, a

\$50 million voter-approved bond⁴ was passed in 1979, and the County PDR program, Farmland Preservation Program, was established. Throughout the 1980s the County acquired development rights to protect 12,600 acres of farmland through the program. County efforts to protect farmland expanded when the 1985 King County Comprehensive Plan designated approximately 40,000 acres as Agriculture Products Districts (APDs). The APDs are intended to be long-term designations in which agriculture should be the principal land use within the APD and land uses adjacent to APDs should be designed to limit conflicts with agriculture. The five areas zoned as APDs (see Figure 3) were determined through the following criteria to increase their potential to remain as agriculture use:

1. Soils are capable of productive agriculture (Class II and III soils);
2. Land is undeveloped or contains only farm-related structures;
3. Parcel sizes are predominantly 10 acres or larger; and
4. Much of the land is used for agriculture, or has been in agricultural use in the recent past. (King County Comprehensive Plan, 1985, p. 113)

⁴ A \$35 million bond was first put on the ballot in 1978 with 59.77% in favor—narrowly missing the 60% required vote. An extensive public-media campaign was conducted by a citizen-based group, *Save Our Local Farmlands Committee*, and the \$50 million bond was passed November 6th, 1979 with 62.96% votes (*Save Our Local Farmlands Committee*, 1979).

Figure 3: King County Agricultural Areas⁵

*Areas zoned as “A” (agricultural) and “RA” (rural area) also include farmland; however, these areas do not have the long-term designations as intended in the APDs (King County Comprehensive Plan 1985, p. 114).

While the County’s efforts from the 1960s through the 1980s essentially thwarted the consumption of farmland by protecting a fertile land base from development, a combination of social, economic and regulatory factors have continued to reduce the profitability of farming in the county over the last few decades. Recognizing the need to address these barriers, the County has continually expanded its programming. In 1996, DNRP hired a consulting team to conduct the *Farm and Forest Report*, a study detailing the specific barriers farmers faced and strategies the County could carry out to address those challenges. Many of the barriers described in the report are still prevalent today as evident

⁵ Map created by author. GIS layers provided by King County GIS Center through Washington State Geospatial Data Archival (WAGDA).

in the findings section. Informed by extensive community outreach efforts, a series of programs have since continued or expanded. They include:

- *Agriculture Drainage Assistance Program (ADAP)*: provides technical and financial assistance for farmers who need agricultural ditch maintenance.
- *Agriculture Commission*: A body of representatives that have expertise and interest in the agriculture sector. Commissioners work directly with public officials, county staff, farm producers and citizens on policies and regulations influencing and impacting farming.
- *Puget Sound Fresh (PSF)*: helps connect farmers to urban consumers and businesses through marketing and promotional activities for direct marketing opportunities (i.e. farmers markets and CSAs⁶). Now managed by Cascade Harvest Coalition.
- *FarmLink*: matches retiring farmers with current or new farmers for mentoring. Now managed by Cascade Harvest Coalition.
- *Livestock Management Program*: assists farmers in meeting the Livestock Management Ordinance (K.C.C.21A.30) requirements of protecting environmental qualities (i.e. water quality) from the impact of livestock.

The above summary of programming is not wholly representative of all efforts being made to protect farming. Other agencies have worked in conjunction with the County or through individual efforts to ensure farming remains a viable sector in the county. Agencies such as King Conservation District, Washington State University (WSU) King County Extension, Natural Resources Conservation Service and the Farm Service Agency, to name a few, have made considerable contributions to the countywide wide effort to protect farming.

⁶ CSAs or “community supported agriculture” connect residents directly to farmers through a subscription program where residents pay farmers early in the year and later receive a monthly or weekly supply of fresh produce in the growing season.

King County Farmland Today

Today, there are 1,790 farms cultivating 49,285 acres of farmland in King County (USDA, 2007). The five APDs now total over 42,000 acres—68 percent of the total farmland with 13,200 acres (21 percent of total) permanently preserved through the County’s Farm Preservation Program. According the 2007 Census of Agriculture, total acres farmed has actually increased since 2002 by 18 percent (41,769 acres). In addition, the market value of production has also risen six percent to \$127,269,000—crops sales account for 36 percent and livestock for 64 percent (USDA, 2007). In fact, King County now ranks 13th in the state in value of production—a jump from 1997’s county ranking of 16th. Census figures demonstrate that the agriculture sector has continually expanded through an increasing number of farms, acres farmed and the value of products sold over the past fifteen years (see Figure 4, Figure 6, and Figure 5).

Figure 4

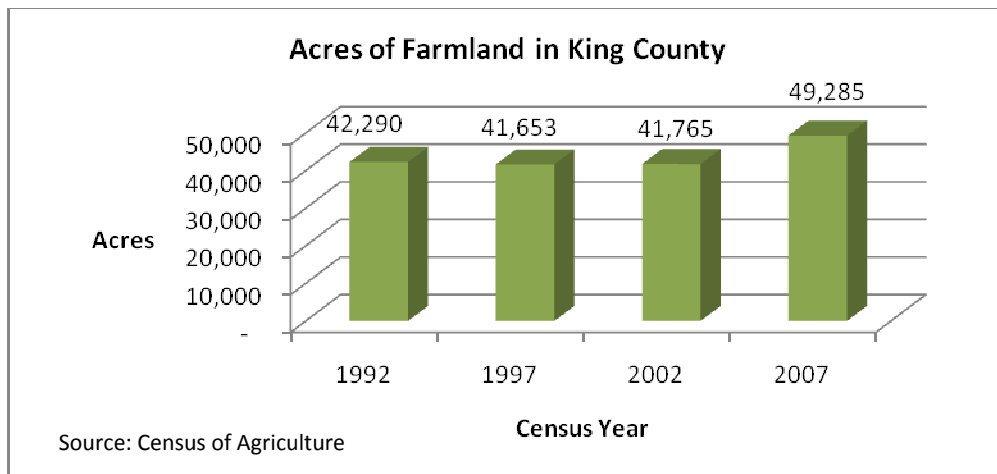

Figure 5

Figure 6

Interestingly, the steady increase of number of farms and acres farmed parallel a spike in the number of farms with lower market values of products sold (i.e. below \$50,000). Meanwhile, as seen in Figure 6, the farms with higher market values (i.e. above \$100,000) dropped during this same time period. The increase of farms with lower market values may be explained by the rise of small-sized farms entering the market sector (see Figure 8). Though this may suggest that larger farms are being subdivided, there has also been an overall increase in the number of acres cultivated (see Figure 4).

Figure 7

Figure 8

The “new” farmland may be accounted for several reasons such as being previously fallow, cleared forest, or sales being below the Census threshold of \$1,000. While the County has protected farmland through land use tools such as agriculture production districts and purchase of development rights, the urban population’s demand for locally grown foods has provided an impetus for farmers to actually expand their operations. The growing popularity of the local food movement is evident from the increasing number of farmers markets, CSAs, restaurants and grocers purchasing directly from the farmers.⁷

⁷ According to the Puget Sound Fresh’s 2009 Farm Guide, there are currently 39 farmers market, 29 u-pick farms, and seven CSAs in King County, among other direct marketing opportunities.

Chapter 3: Methodology

In an effort to gain an understanding of the farming community's perceptions regarding the future of farming in King County, a combination of quantitative and qualitative analysis was applied. Specifically, content analysis was used to identify themes through a process of interpreting and coding the data (i.e. farmers' comments) and then tabulating frequencies. Prior to this analysis, however, background research was conducted to provide a context of the views and opinions shared by the farming community.

A review was conducted of reports and plans documenting the past and current farmland preservation programming. Informed primarily by government documents, *Chapter 2* provides a background of the County's role in protecting farmland from being converted into nonfarm uses as well as promoting farming activity within the county. Coupled with this historical overview, a profile of today's farming sector is provided through data extracted from the recently released 2007 U.S. Census of Agriculture. This background research was critical in familiarizing me with the county agriculture sector in order to effectively interpret and code the survey responses.

In an effort to incorporate the farming community's input into the FARMS report, King County staff and the Agriculture Commission developed two survey methods to collect community feedback: public meetings and a questionnaire. Five public meetings were held through the months of January to April 2009, one in each of the various farm districts of the county. Four meetings were held in a town near one of the five agriculture production districts; a fifth meeting was held on Vashon Island. By conducting the meetings at the district level, farmers were able to attend the meeting in the localities in which they farmed. As a result, the public comments indicated some district-specific concerns and allowed for cross-comparison between the districts. Table 3 shows the meeting location and the number of meeting participants.

Table 3: Meeting Location and Attendance

Meeting Location	APD Represented	Date	# of Participants
Auburn	Upper and Lower Green	February 12 th	27
Carnation	Snoqualmie	January 22 nd	54
Enumclaw	Enumclaw	March 12 th	41
Vashon	Vashon Island*	April 9th	22
Woodinville	Sammamish	January 8th	22

*Vashon Island is not zoned as an APD.

Each meeting was facilitated by an Agriculture Commissioner—this provided the facilitator with familiarity of the attendees as well as the issues. The facilitator led an informal discussion on the challenges farmers face, how they have adapted their farming operations and what resources they needed to continue farming in King County. Facilitators referred to the open-ended survey questions given to each farmer to guide the conversation (see *Appendix B*). During the discussion, county staff wrote down the comments on poster-sized paper for participants to view. Comments were recorded on laptops to capture as many comments as possible.

A questionnaire was created to provide an alternative method of collecting the farmers' input. The questionnaire included two sets of questions. The first set was designed to learn the general characteristics of the survey respondents and their farming operations while allowing for comparison to countywide figures of the recently released 2007 U.S. Census of Agriculture data. The second series of questions were open-ended and were designed to learn the issues, emerging trends in farming operations, and needed resources for farming in King County. The survey was distributed to all farmers at the public meetings and was also posted online for those unable to attend the meetings. Similar to the public meetings, the surveys were voluntary and reflect the opinions of individuals who were informed of the *FARMS Report* and had the interest and/or ability to participate.

The survey included five open-ended questions in which this analysis focuses on:

- How is your farm operation changing?
- What kinds of resources or services do you need to be a successful farmer in the future?
- What are the trends you think are important to your operation and your industry?
- What are your plans for your farm property in the future?
- What concerns do you have regarding farming in King County?

Thematic content analysis of the collected feedback was used to identify the farming community's perspectives of farming in King County. This form of analysis allowed me to examine the open-ended survey responses and reduce the extensive amount of information into themes. The coding procedure included breaking down the data into "precisely defined terms" or themes through recognizing key words or phrases, tabulating the frequencies, and noting whether the theme was a discussion topic at the public meetings (Leedy and Ormrod, 2005, 142). Based on this method of interpretation and reduction (Creswell, 1994, 154), the following research design was applied:

- *Step 1:* Each questionnaire was assigned a unique identification number (ID) to provide a tracking system. This allows for repeatability and consistency as the researcher can retrace an identified theme back to the original source of data.
- *Step 2:* A table was created for each of the five open-ended questions on the survey (i.e. questions #14-18). Written responses were then assigned a thematic code according to the content of the response, and the survey's ID was inserted into the table. These responses were then tallied (see *Appendix C*).
- *Step 3:* The survey responses were then categorized into three major themes: (1) challenges and concerns, (2) emerging trends in farming operations and (3) needed resources and services. Each sub-category within these three was given a unique ID,

and the number of survey references was tallied through a new set of tables (see *Appendix D*).

- In order to evaluate the commonalities between the two data sets, I reviewed public meeting notes, and if a topic (i.e. sub-category of three main themes) was discussed it was noted by an “X” as displayed on Table 5, 6 and 7 in *Chapter 4*. Frequencies of public meeting comments were not counted due to the informal structure of the meetings and the difficulty in assessing the significance. For example, a participant may have mentioned an issue which solicited responses from others such as head nods and clapping; however, the issue was not brought up a second time. Therefore, if frequency was used as a measure, this topic would appear to have little prevalence while in reality it was a significant issue.

Figure 9 demonstrates the coding process as outlined above. The appendices include the tables in their entirety as well as all the survey responses collected (see *Appendix C-F*).

Figure 9: Coding Process

Step 1: ID number is entered into table according to theme. See example below:

Question: "How is your farm operation changing?"

Response: "Moving from wholesale to direct marketing" –Survey #5

Step 2: Response themes assigned a "Major Theme Code" and all responses are tallied.

Step 3: Responses from total column for each "Major Theme" are entered into the second table.

Example: Major theme "Cater to Local Market" has 86 survey references.

Step 4: "X" indicates when the major theme was discussed at the public meetings.

Survey #5 (Farmer from Snoqualmie APD)

		#17	12					
		#18	0					
		Total:	86					

From the Survey and Meeting Themes Matrix (Appendix D)

King County staff made significant outreach efforts to include a diverse range of farmers throughout the county to collect feedback. Marketing tools included a postcard mailing, online marketing, emails sent to listserves, and personal phone calls (see *Appendix A*). Nonetheless, perceptions of meeting participants and survey respondents may not be entirely representative of the farming community as a whole for several reasons:

- *Environmental conditions:* In early January 2009 the county experienced a record-breaking flood. Due the severe impact flooding had on farmland and their operations, flooding issues were of heightened concern and therefore dominated public meeting discussions and survey responses for several meetings, particularly the Snoqualmie meeting.
- *Scheduling and location constraints:* A single meeting in the evening was held in four APDs and Vashon, which limits the opportunity for some individuals to attend.
- *Not all racial/ethnic/cultural groups represented:* Staff sought participants from a broad range of backgrounds, but this may not include all racial, ethnic or cultural groups in the farming community.⁸
- *Public meetings and the survey were conducted in English:* Language translation may have increased participation by residents who speak languages other than English.
- *Non-farmer meeting participants:* Due to the public nature of the meetings, some meeting participants were not farmers. These individuals shared interests in preserving farmland in King County, and particularly, the local food movement. However, the views are not necessarily similar to those of a farmer. The data collection process noted who made the comments and culled out non-farmer comments. Non-farmer interests and concerns are being addressed elsewhere in the larger *FARMS Report*.

⁸ The County outreached to Hmong farmers and provided translations at the meetings for Hmong meeting participants.

- *Meeting format:* Due to the informal meeting format, some individuals may have been hesitant to speak up and may have needed prompting by a more guided discussion through facilitator following an outlined series of questions.

Despite the limitations, consistent themes emerged from the public meeting discussions and returned questionnaires. Overall, there was little difference between the survey data versus the meeting data. Nearly all the themes identified from the survey analysis, as seen in *Chapter 4*, were discussed in each of the five public meetings. Furthermore, major discussion topics in the public meeting also appeared in the survey analysis. There were many commonalities in the feedback between the districts; that is, most themes are countywide and not APD-specific perspectives. *Chapter 4* provides a summary of the survey results and a brief discussion of each of themes identified.

Chapter 4: Findings

After four months of collecting surveys and conducting the five public meetings, comments regarding the future of farming from the farming community's perspective were compiled. There were a total of 89 surveys—representing 5 percent of 1,790 farms in the county. In addition, nearly 170 farmers attended the public meetings. Overall, survey respondents and meeting participants together represent 14 percent of the county farmers. Through analysis of the data from the surveys and public meetings as detailed in *Chapter 3*, three themes were identified under three main categories: (1) major concerns and challenges, (2) emerging trends or adaptations in the farming industry and (3) needed resources and services for agriculture to remain a viable industry in the county. Prior to discussing these findings, a look at survey respondent profiles is assessed.

Survey Respondents

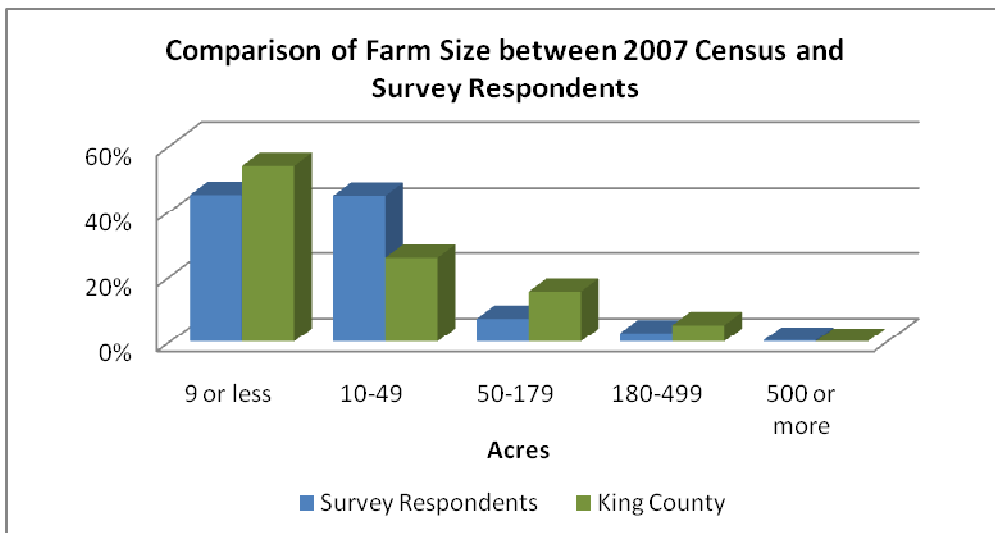

In addition to the open-ended questions, the survey included a series of questions to provide a general profile of the farmer and their farming operations. Utilizing the recent Census of Agriculture 2007 data to design the questions allowed for a comparison of survey respondent characteristics to the Census' countywide figures. As seen in Table 4, there are strong similarities between the survey sample responses and countywide Census figures. For example, farming is the primary occupation for 42 percent of King County farmers—a mere three percent difference from the survey's result of 45 percent. Other similarities include farmer's place of residence and status of land ownership. Minor differences between the sample and Census figures include the size of farms operators represent (see Figure 10).

Table 4: Comparison of 2007 Census King County Figures with Survey Responses

	County	%	Survey	%*
# of Farms	1,790		89	
Farming is primary occupation	753	42%	36	45%
Farm Size (by acres)				
9 or less	802	45%	42	53%
10-49	806	45%	21	27%
50-179	127	7%	12	15%
180-499	48	3%	4	5%
500 or more	7	0.4%	0	0%
Total	1,790	100%	79	100%
Farm Ownership				
Full owner	1,494	83%	55	71%
Part owner	164	9%	6	8%
Tenant	132	7%	17	22%
Total	1,790	100%	78	100%
Residence				
On farm	1,524	85%	57	75%
Off farm	266	15%	19	25%
Total	1,790	100%	76	100%

*Based on the number of responses to the survey question, not the total number of surveys.

Figure 10

Based on these general characteristics, the survey respondents' population is relatively reflective of the larger King County population. The Census data is limited to the county, whereas the survey data can be disaggregated by APD. For example, 35 percent of survey results are from Snoqualmie APD farmers (see Figure 11). *Appendix E* and *F* provide all responses to the survey questions. The themes discussed in the following sections are noted as APD-specific or countywide issues. Despite the limitations in the dissemination and collection of the survey (as described in *Chapter 3*), the survey feedback and comments are fairly representative of the King County farming community as whole.

Figure 11

Major Concerns and Challenges

Farmers shared a range of concerns that have a direct impact on their ability to stay in operation. Eight key issues were identified and are largely countywide challenges. Table 5 outlines the main topics followed by a brief description and discussion of each theme. Only three challenges were not discussed at all five public meetings as noted by the shaded boxes in Table 5.

Table 5: Major Challenges Identified by Farmers

Major Concerns/Challenges	# of Survey References	Discussed in Public Meeting				
		Auburn	Enumclaw	Sammamish	Snoqualmie	Vashon
Competing Land Uses	39	X	X	X	X	X
Financial Constraints	35	X	X	X	X	X
Flood Impacts	34	X	X		X	
Local Regulatory Constraints	23	X	X	X	X	X
Low Prioritization of Rural Interests	18	X	X	X	X	X
Definition of Agriculture	17	X	X	X	X	
Environmental Protection Regulations	6	X	X	X	X	
Vulnerability of Next Generation Farmers	5	X	X	X	X	X

Competing Land Uses

Despite County efforts to protect farmland, farmers are concerned with the loss of farmland to development and the associated incompatible land uses permissible under the

“Ultimately, the [development] pressure destroys agriculture and/or people who just want to keep the land whole.” –Enumclaw APD Farmer

current zoning regulations. In particular, farmers noted large single family houses or “McMansions” convert fertile farmland into permanent non-agricultural uses and are out of character with the rural landscape. Large-tract homes create fragmentation within agricultural areas⁹ and lead to nuisance complaints, localized soil compaction, and increased runoff. The allowance of large-tract homes in agricultural areas pushes up land values, creating financial burdens for those interested in purchasing land or expanding their operations. Closely tied to this issue is the County’s legal definition of agriculture which is addressed as a separate issue later in this report.

⁹ A contiguous land base for agriculture reduces conflicts and discourages non-farm uses and as a result protects the local farming economy (Daniels and Bowers, 1997, 125).

Financial Constraints

According to the surveys and meeting discussions, the financial constraints that reduce the profitability of farming are a countywide issue.

Farmers specifically cited the high costs of land, permitting fees, infrastructure, and tax assessments (particularly on agriculture accessory buildings), as significant financial challenges. In

“I am going through a permit nightmare with the County right now, getting a permit to pave 4,000 sq.ft. of existing gravel road. My initial estimate for plan review was over \$22,000. ...That's more to review the plans than the cost to create the plans and pave the road.”

particular, farmers are frustrated with the permit fees charged by the County to build—which they uniformly view as excessive. Several farmers provided specific examples to illustrate their point. Compounding these high expenses, farmers find it difficult to obtain loans to purchase land and build infrastructure. Several farmers noted they were forced to work a second job in order to make an adequate living. In fact, farming provides for less than half the income of 49 percent of survey respondents.

Flooding Impacts

In early January 2009 there was record-breaking flooding throughout the county and neighboring areas. As a result, the Sammamish, Snoqualmie and Auburn meetings and the

“Farming in the [Snoqualmie] Valley is really dictated by the flooding.” – Snoqualmie meeting attendee

surveys¹⁰ received during that time period stressed the burdens caused by flooding and the need for relief efforts by the County. In particular, the Snoqualmie meeting was emotionally charged as farmers’ properties had been severely impacted, and they had only begun to recover.¹¹

¹⁰ Of the 34 survey references regarding flooding issues, all but four were from Snoqualmie APD farmers.

¹¹ The County’s Snoqualmie Flood-Farm Task Force, established several years ago by Motion 12559, held a meeting in late January to deal more directly with flood issues.

Specific flood issues farmers raised were as follows:

- Poor coordination, communication and control of releasing flood waters. King County Flood Warning Center is managed by the County’s Office of Emergency Management which coordinates with the U.S. Army Corps of Engineers and Seattle Public Utilities regarding dam operations.
- Increasing development exacerbating flooding conditions through increasing runoff.
- Need for regulatory flexibility regarding the construction of elevated “farm” or “critter pads” recently adopted by Ordinance 15883.
- Production season is shortened for farmers hesitant to grow crops during winter months when the flooding tends to occur. This leads to a decrease in sales and a limitation of what can be grown or raised.

Local Regulatory Constraint

The local zoning ordinance and permitting process was frequently cited as cumbersome and restrictive to the business of farming. Farmers frequently cited that local regulations either

“There are some conditional uses that exist, but the time, permitting fees and requirements often make them unrealistic options.” –King County Farmer

prohibit or limit their ability to build and use structures for activities directly impacting the economic feasibility of their farming operations. Farmers expressed frustration with the permitting process or as one participant called it, the “permitting quagmire” as well as specific regulations. Issues include:

- Lengthy and costly permitting process that is difficult to navigate
- Unable to legally build structures to support farming operations. Processing facilities, office space in agriculture accessory buildings, and housing for farmer workers were cited as examples.
- Restrictions on building materials allowed (this is particularly an issue for Vashon farmers)

Several farmers noted that the inflexibility of land use regulations impedes their ability to change and adapt their operations to meet market demands.

Low Prioritization of Rural Interests

Farmers expressed concern that rural interests are a low priority for the County and its residents.

Farmers asserted there is poor understanding of farming needs, which is evident through some of the challenges in the permitting processes and the

“[County] budget and staffing are overwhelmingly dominated by urban/environmental concerns to the detriment of the rural/agricultural population and economy.” –Lower Green APD Farmer

allowable and prohibited uses in the APDs. Furthermore, farmers specifically fear the loss of King County Ag Programs and staff that provide valuable technical and educational support. Several farmers noted the County needed to improve urban-rural relations as well as raise the urban population’s awareness and support of local farming.

Definition of Agriculture

The most controversial issue *within* the farming community is the legal definition of agriculture; that is, what land uses are labeled as “agriculture” by the County and therefore receive the incentives designed to protect farming (i.e. differential tax incentives based on current use and reduced regulations regarding the critical

“Keep farmland for people food, not for equestrian estates which take away farmland and drive up land prices.” –King County Farmer

“I am concerned that the do-gooders who don't own horses are going to try to change our way of life out here in the country, by changing horses from livestock to ‘pet.’ Which in turn will change our tax status from agricultural to residential.” –Enumclaw APD Farmer

area ordinance). The point of contention is the inclusion of equestrian uses within the definition. Those opposed to equestrian uses being included in the definition assert that horse farms or “hobby farms” drive up land prices and reduce the amount of farmland available. Sno-Valley Tilth released public testimony in March 2009 on “The Future of Farming in King County.” The testimony suggests that the definition of agriculture within the APDs be based on activities that relate to the commercial production of food and forage for human consumption or commercial production of fiber products. Farmers supporting

the inclusion of equestrian uses assert that raising horses are a type of farming and provide source of income for those individuals. Currently, there is no legal definition of agriculture at either the county or state level.

Environmental Protection Regulations

Another contentious issue is the impact of environmental protection regulations. Though there were only six survey references highlighting this issue, the public meeting discussions

“Increasing environmental/ESA burden on agriculture can kill agriculture in this county.” –Lower Green APD Farmer

demonstrated that this was a larger issue, particularly for areas with salmon-bearing streams that lead to Endangered Species Act (ESA) restrictions. Some farmers stressed that complying with regulations is in direct conflict with farming operations. Farmers asserted that environmental regulations reduce access on their land, create drainage issues and limit their operations’ profitability. While some farmers had strong views that they were being over-regulated, others contended that there should be more of a “balanced” treatment in which environmental interests should not be favored over farm interests.

Vulnerability of Next Generation Farmers

Farmers voiced considerable concern for the next generation of farmers to feasibly enter the industry due to the many financial constraints. They repeatedly cited that today’s farmers are nearing retirement¹² and that high costs of farming will likely prevent potential new farmers from entering the industry.

Additionally, farmers noted the need for technical and education assistance for new farmers. The meeting discussions revealed that many farmers are unaware of local programs, such as FarmLink, working to address these issues.

“We are not encouraging people of all ages to get into the agri-business industry. I am also concerned that there are not enough educational opportunities locally for those who are interested in farming.” –King County Farmer

¹² According to the 2007 Census of Agriculture, the average age of farm operators in King County is 55 years old.

Emerging Trends and Adaptations

Due to a culmination of economic, environmental and regulatory factors, King County farmers have adapted their operations in order to stay in the business of farming. Through the survey questions and meeting discussions pertaining to farmers’ current farming practices and future plans for their properties, four countywide trends emerged from the analysis. All of the trends identified were discussed in each of the public meetings (see Table 6).

Table 6: Operation Trends Identified by Farmers

Trends/Adaptations	# of Survey References	Discussed in Public Meeting				
		Auburn	Enumclaw	Sammamish	Snoqualmie	Vashon
Cater to Local Market	86	X	X	X	X	X
Continue to Farm	44	X	X	X	X	X
Increase Capacity	42	X	X	X	X	X
Change of Farming Methods	25	X	X	X	X	X

Cater to Local Market

Farmers repeatedly cited that their operations were tailored to respond to local market demands, particularly for the urban population. Farmers have adopted a range of strategies which include:

- Selling products through direct marketing opportunities such as farmers markets, farm stands and internet sales¹³
- Providing value-added products, such as preserved and dried goods
- Growing organically-grown produce and/or high-value products

“The practical thing to do is to provide for our own local economy.” –
Snoqualmie Farmer meeting attendee

¹³ 34 percent of survey respondents sell products at farmers markets and 24 percent at farm stands. See Appendix F for complete survey results.

- Creating agri-tourism and educational opportunities for customers (i.e. hayrides, corn mazes, classes, special event space, etc.) on farm property

The growing popularity of the local food movement is evident from the increasing number of farmers markets, community supported agriculture (CSAs), restaurants and grocers purchasing directly from the farmers and other direct marketing opportunities. According to the Puget Sound Fresh’s *2009 Farm Guide*, there are currently 39 farmers market, 29 u-pick farms, and seven CSAs in King County, among other direct marketing opportunities. These approaches are similar to other agriculture areas in metropolitan areas throughout the country. This is evident by the increasing number of farmers markets¹⁴ and federal government support through USDA programs such as Farmers Market Promotion Program (FMGP) and Farmers Market Nutrition Program (FMNP).

Continue to Farm

Despite the financial and regulatory challenges they confront, the farmers frequently expressed their determination and commitment to remain in the business of farming. When asked of their future plans, farmers not only discussed their plans for farming practices and types of product to be grown or raised but also the property itself. Several emphasized their desire for their property to remain under agriculture uses and not be developed by the next generation and/or future property owners. While some farmers are preparing to keep the property in the family, other farmers are interested in leasing their properties to potential new farmers. However, it is worth noting that four respondents shared they are strongly considering moving their farm operations outside of King County due to financial and regulatory constraints.

“The current plan is to transfer farm ownership to my daughter and son in law. They both currently work on the farm part-time and have a strong desire to continue the family tradition. They would be the fourth generation to farm this property.” –Snoqualmie APD Farmer

Increase Capacity

¹⁴ Today there are 4,685 farmers markets in the U.S., a nearly 270% increase from 1994 (USDA, 2008).

Farmers' commitment to staying in the business was emphasized by numerous survey references and meeting comments regarding their plans to expand their operating capacity. Several common schemes have been adopted by farmers to essentially increase the volume of sales. They include:

- Increasing amount of acres cultivated on existing property or through purchasing more land
- Improving or building infrastructure on property such as housing, barns, critter pads, wells and greenhouses
- Developing agri-tourism and educational opportunities on the farm
- Providing value-added products through on-site processing facilities

"We want to expand into other u-pick small fruits and crops and require 2 greenhouses to do salad greens and tomatoes. We want to go from part-time to full-time within the next 5-6 years." – Lower Green APD farmer

Change of Farming Methods

In addition to expanding their capacity, farmers are also altering their farming methods and practices. Influenced by rising public concerns of climate change impacts, use of synthetic pesticides and herbicides, and food safety issues, farmers noted there is stronger demand for

"[I] have gone from traditional farming and the use of synthetic fertilizers & pesticides/herbicides to organic methods, including crop rotation, winter cover crops, natural pesticides, etc." – King County Farmer

organic and locally grown products. Some of the newer methods mentioned include small-intensive farming, permaculture, biodynamic and diversifying crops grown. As seen in *Appendix F*, the survey results demonstrate more environmentally sustainable practices are in currently in use. Fifty percent of respondents use non-certified organic practices,¹⁵ 47 percent use natural fertilizers and 65 percent use cover crops.

¹⁵ USDA accredits "certifying agents" to certify that organic production and handling practices meet the national standards (www.ams.usda.gov). Farmers using organic methods are not necessarily required (or desire) to receive accreditation.

Needed Resources and Services

Though King County farmers have shown resilience by accommodating their operations to meet the market demands and comply with the multiple layers of regulations from the local to federal level, the farmers’ comments repeatedly expressed a continued need for farmland preservation programs at the local level to protect farmland from development pressures. They additionally called for measures that promote farming as a business. The call for resources and services are a paralleled response to the challenges outlined earlier in this chapter. The major resources and services identified in the surveys were discussed in each of the public meetings (see Table 6).

Table 7: Needs Identified by Farmers

Needed Resources & Services	# of Survey References	Discussed in Public Meeting				
		Auburn	Enumclaw	Sammamish	Snoqualmie	Vashon
Regulatory Flexibility & Efficiency	54	X	X	X	X	X
Prioritization of Rural Interests	52	X	X	X	X	X
Financial Assistance	26	X	X	X	X	X

Regulatory Flexibility & Efficiency

To overcome regulatory constraints, farmers called for improved regulatory flexibility of allowable land uses and the overall efficiency of the permitting process. Farmers cited the following needs from the County:

- Adapt land use codes to be more sensitive to and supportive of farming operations
- Improve permitting system’s efficiency by shortening the length of the process and providing permit assistance
- Provide assistance and user-friendly materials to navigate the regulatory system and understand the role of various agencies involved (i.e. DDES, Public Health, etc.)

“[Farmers need] More support from County and State regulators making it clear that farming is a valuable pursuit in this area.” –Snoqualmie APD Farmer

Of the total 54 survey references, 12 references specifically requested improving the permit system and seven cited allowing flexibility in farm worker housing. Both needs were also specifically brought up in public meeting discussions.

Prioritization of Rural Interests

In addition to regulatory and financial relief, farmers also offered four general areas in which the County can support the local farming industry and thereby prioritize rural interests. They include:

- Technical assistance and educational resources provided by the County’s agriculture programming and staff. Specifically, farmers requested services for supporting potential new farmers.

“[County needs] simplified permitting to allow a farmer to take quick advantage of extra time and money that may not be there by the time permit is issued. Lower permit fees, increased site specific flexibility and much better communication and competency from permitting agency.” –King County Farmer

- Infrastructure supporting farming operations such as: drainage assistance and maintenance,¹⁶ recycling program for plastic and twine from straw bales, disposal for dead livestock, feed stores, and processing facilities.
- Promotion of local farms through public awareness and education efforts and expanding direct marketing opportunities.

Financial Assistance

Farmers provided examples of financial assistance that would improve the economic feasibility of farming in King County. They include:

- Lower permit fees
- Tax incentives or re-evaluation of land value assessments to lower taxes (several farmers note the difficulty in building agriculture accessory buildings due to high taxes associated with this type of development)
- Cost-share programming for infrastructure (i.e. building and equipment) improvements
- Promotion of institutions to purchase from producers in the county
- Loan assistance to purchase land, equipment and build infrastructure such as barns.

The challenges, industry trends and needed resources and services described in this chapter are based on the opinions of King County farmers who participated in outreach process. Though the survey and public meeting formats were framed to gain insight of the farmers' perceptions of their future in farming, the findings largely focus on current and ongoing issues that are often viewed as hurdles to their ability to farm in the future. The following section compares and contrasts the themes identified at the APD level as well as to other relevant research to provide further context of the findings.

¹⁶ Though there were only five survey references, drainage maintenance was a significant need according to the public meeting discussions.

Chapter 5: Conclusion

In response to King County's concern about the future of farming in the County, the Agriculture Commission and County staff sought input from the farming community on the present conditions and challenges of the agriculture industry. The themes identified herein reflect the perceptions of farmers through the compilation of comments from nearly 90 surveys, and input from over 170 public meeting participants were categorized into three areas: (1) major challenges farmers confront, (2) trends in farming and (3) needed resources and services to keep farming viable in the county. Due to the diverse nature of the King County farming community, there were at times conflicting views amongst the farmers themselves. While there was wide agreement across the county on the identified themes, these findings also suggest there are some issues that are more significant to particular APDs and are not necessarily countywide problems. Recognizing that many of the issues are similar among the APDs, farmer input indicates that there should be flexibility in the regulations to meet the unique needs of each APD. The following are several examples of issues, highlighted through the feedback, for which the County could address individual APDs:

- Snoqualmie APD: many farmers expressed interest in defining agriculture as commercial production of food and forage for human consumption or commercial production of fiber products. The public testimony of the Sno-Valley Tilth specifically addresses this issue.
- Snoqualmie APD and Enumclaw APD: the unique flooding conditions--prevalence of flooding, the release of flood waters, and control of development within the riparian zone--call for a "flood plan" to address the complexities of this issue as it involves other government entities such as the Army of Engineer Corps and FEMA.
- Vashon Island: nearly all of the farms on Vashon Island are less than five acres, which impacts not only how they operate but the size and type of infrastructure required. County standardization of agriculture accessory buildings does not meet their specific needs and are cost-prohibitive.

Many of the themes identified in this report are not necessarily unique or new to King County farmers. By drawing comparisons between two reports, King County’s *Forest and Farms Report* (1996) and Washington State’s *The Future of Farming: Strategic Plan for Washington Agriculture 2020 and Beyond* (2009), it is evident that many challenges are longstanding in the County and are also statewide concerns. These two reports were driven by a community participant process to identify critical challenges and potential strategies through farmers’ input. The *Forest and Farms Report* outlines six barriers through King County farmers input and provides twenty-seven strategies based on “the understanding that the community of farmers in King County is extremely diverse” (p. 5-1). The recently released State’s *Future of Farming* report offers recommendations for five key areas focused on “increasing understanding among state policymakers and call for proactive policies to reinforce agriculture’s socio-economic role” (p. 9). As demonstrated in Table 8, the various strategies and recommendations these reports developed are addressing similar concerns to those raised by farmers in this report.

Table 8: Common Characteristics of Report Findings

FARMS Major Concerns/Challenges	<i>Forest and Farms</i> Report Strategies (1996)	<i>Future of Farming</i> Recommendations (2009)
Competing Land Uses	X	X
Financial Constraints	X	X
Impacts of Flooding		
Local Regulatory Constraints	X	X
Low Prioritization of Agriculture	X	X
Definition of Agriculture		
Environmental Protection Regulations	X	X
Vulnerability of Next Generation Farmers	X	X

In this limited comparative analysis of the reports, there are several characteristics that stand out and are worth considering as the County determines its next steps to addressing these issues. They are:

- All six “burdens” from the County’s previous efforts in evaluating the agriculture sector were major issues in this report as well. *The Forest and Farms Report* challenges include: “(I) high cost of land, (II) the low [profitability] of farming, (III) insufficient level of technical support available to local farmers, (IV) need for better marketing and promotion, (V) regulatory requirements and (VI) population growth and conflicts with farmers.”
- All five key areas of the State’s report were identified as major themes within this report. They include: “(1) make agriculture a priority, (2) eliminate regulatory barriers, (3) protect resources, (4) strengthen support services and (5) harness emerging opportunities” (i.e. local market demand).
- Neither report specifically addressed the impacts of flooding. This suggests that the conditions of flooding, partly exacerbated by surrounding development, are not as prominent an issue for the majority of Washington counties (most of which are rural). Furthermore, *Forest and Farms* not addressing flooding issues indicates this is a temporal issue. This study was conducted during a time of record-breaking flooding which directly impacted the input received. If the meetings and survey had been conducted in the summer or year of no flooding, it may have not been identified as a major issue.
- Neither report discusses the issue of the legal definition of agriculture. This concern may be of a more recent nature as land values have risen and competition for farmland has increased in the metropolitan area.
- Though the State’s report addressed financial constraints such as ensuring long-term and short-term credit for farmers, the feedback from King County farmers demonstrates that some of the financial burdens are unique to King County. First, farmers stressed the high land values due the proximity to urban areas and

development pressures. Second, permit fees make it cost-prohibitive for farmers to build the necessary infrastructure for their operations.

The challenges, industry trends and needed resources identified in this report are not intended to be inclusive, nor did the comprehensive four-month, on-the-ground methodology seek consensus. This report, based on the farmers' perspectives, offers an opportunity to expand discussion, debate, and further develop priorities and strategies to address the County's agriculture sector's needs and interests. The input of farmers is invaluable as the County plans for the future of farming in King County.

Future of Agriculture, Realize Meaningful Solutions (FARMS) Survey

Please take a few minutes to fill out this survey for the King County Agriculture Commission. Survey responses and tonight's discussion will help inform the Commission's FARMS Report. The report will include recommendations for preserving farmland and promoting farming viability as requested by the King County Council in Ordinance 16172. Please return the survey tonight or mail to: Steve Evans, King County, Suite 600, 201 S Jackson St, Seattle, WA 98104. Thank you for your valuable input!

1. Do you farm or live in an agriculture production district (APD)? Yes No (Please share your zip code: _____)
2. If so, which one? Enumclaw Upper Green Lower Green Sammamish Snoqualmie
3. Are you actively farming? (If no, please skip to #15)
 Yes No Not now, but I plan to in future. Please specify when: _____ years.
4. Is farming your primary occupation (more than 50% income)? Yes No
5. How many years have you been farming? 2 or less 3-4 5-9 10 or more
6. Do you own or rent your farmland? Full ownership Part-ownership Rent
7. Where is your place of residence? On the farm Off the farm
8. What is the size of the farm (total acres)?
 Less than 5 5-9 10-49 50-179 180-499 500 or more
9. Three major public agencies provide services and assistance to farmers in the county. What services have you used? (check all that apply)
 Classes/Training Floodplain Management Puget Sound Fresh (marketing)
 Drainage Assistance Livestock Management Transfer of Development Rights Program
 Farm Plan Permit Assistance Other _____
10. What service providers have you used? (check all that apply)
 King County Agriculture Washington State University (WSU) King County Extension Natural Resources Conservation Service (NRCS)
 King Conservation District (KCD) Farm Service Agency (FSA) Other _____
11. What agricultural practices do you use? (check all that apply)
 Certified organic Natural fertilizers Organically approved pesticides/herbicides
 Organic but not certified Synthetic fertilizers Synthetic pesticides/herbicides
 Cover crops Genetically modified seeds Other _____
12. How do you sell your farm products? (check all that apply)
 Auction Farmers Market Institutions (i.e. schools) U-Pick
 Brokerage Farmstand Inter-farm sales Wholesaler
 CSA Grocers Restaurants Other _____

Front page of survey (questions #1-12)

13. What do you grow or raise?

14. How is your farm operation changing?

15. What kinds of resources or services do you need to be a successful farmer in the future? *(If you are not currently a farmer, please let us know what you would need to become one.)*

16. What are the trends you think are important to your operation and your industry?

17. What are your plans for your farm property in the future? *(If you would like to lease your property to a farmer, please let us know how we can contact you.)*

18. What concerns do you have regarding farming in King County?

19. If you do not farm, please share your interests in the future of farming in King County?

Backside of survey (questions #13-19)

Appendix C: Responses by Survey Question

The following tables categorize the survey responses for each of the five open-ended survey questions (i.e. #14-18). Any categories that are in quotation marks reflect exactly what was written on the survey with no further explanation provided. The numbers farming districts (i.e. Snoqualmie) columns represent the unique ID number assigned to each survey and where the respondent farms. The “total” column is a count of the responses. The numerical code in the left column represents the major theme the response theme is assigned. The tally of each theme is then transferred to the Survey Themes Matrix (Appendix D). Themes with less than two responses were generally not assigned a code.

Question#14: How is your farm operation changing?

(77 responses of 89 surveys)

Major Theme Code	Response Themes	Survey Responses							Total
		Snoqualmie	Sammamish	Enumclaw	Lower Green	Upper Green	Vashon	NA	
13	No changes in farming operation							37	1
11	Transitioning to direct marketing techniques	5			43			35	3
11	Catering to local market demands, diversifying products, focusing on high-value products and providing value-added products (this includes organic production)	7, 14, 15, 51, 73, 76,		63		41, 62	97	32, 58, 83	13
11	Developing “farm experience” opportunities (i.e. educational programming, hands-on activities, “ag-tourism”)							32	1
22	Change of agriculture practices/methods (i.e. conventional to organic)	74, 90		49			92, 97	36, 50, 69, 87, 98	10
12	Increasing capacity (includes increasing amount of land cultivated and adding or improving existing infrastructure). Several respondents cite this is in effort to meet local market demands.	6, 12, 16, 40, 51, 74, 80, 85, 96	72	54, 57, 65, 81	43, 78		23, 48, 94	34, 46, 94	22
2	Development pressures or “urbanization”	21, 26		22, 55,					5

Major Theme Code	Response Themes	Survey Responses							
		Snoqualmie	Sammamish	Enumclaw	Lower Green	Upper Green	Vashon	NA	Total
				66					
1	Difficulties caused by flooding (sediment dumping, erosion, shortening of season, increased expenses, drainage issues)	2, 6, 8, 10, 11, 14, 15, 17, 21, 40, 80							11
	Shortening of market season or reducing amount produced(due to flooding, limited acreage available or low profit)	11, 14, 15		61	53				5
4	Increasing regulatory issues (i.e. farming near shoreline and rivers)	4, 76, 96		67		60			5
3	Financial constraints: Operation becoming less profitable due to low market prices of product being sold and high expenses (land, equipment, taxes, permit fees, etc.)	13 Flood related- 11, 17, 21, 99		20, 22, 55, 56	78			31, 70	11
	Difficult to find farm labor			30				71	2
	County focus on needs of small crop farmers over large scale operation needs (i.e. dairies)			55, 56					2
	"Becoming more profitable each year"						93		1

Question #15: What kinds of resources or services do you need to be a successful farmer in the future?

(71 responses of 88 surveys)

Major Theme Code	Response Themes	Survey Responses							
		Snoqualmie	Sammamish	Enumclaw	Lower Green	Upper Green	Vashon	NA	Total
15	More efficient and simpler permitting process (Several specifically cited assistance throughout the process).	3, 4, 5, 7, 8, 10, 11		30, 54				32, 69, 84	12

Major Theme Code	Response Themes	Survey Responses							Total
		Snoqualmie	Sammamish	Enumclaw	Lower Green	Upper Green	Vashon	NA	
15	Regulatory flexibility and consistency in the uses and structures permitted to aid farming operations	6, 7, 20, 21, 38, 74, 76, 90, 95, 96		54, 67			23	24, 34, 36, 84	17
15	Regulatory flexibility for water access through wells and irrigations	12, 38, 16						32, 52	5
6	Address farm worker housing issue	10, 12, 76						34, 36	5
16	Financial assistance (cost-share, incentives, lower taxes and permit fees, etc.) to improve affordability of land, equipment and building	3, 10, 11, 51, 76, 96		22, 30	43, 78		23, 48, 92	32, 35, 36, 50, 70, 71, 87, 97	20
16-NR*	Lower taxes			22				50, 97	3
16-NR	Lower permit fees	3, 10, 11		30			23	32	6
16-NR	Improving land value assessments to more adequately favor farming	76						36	2
16	Local government and institutions purchasing locally			61			93		2
23	Drainage assistance and ditch maintenance	7, 8	72		42	60	23		6
	Access to "more land"	20, 45						28, 50, 71	5
1	Relief from the impact of flooding (This includes addressing run-off caused by upstream development.)	5, 7, 8, 10, 11, 12, 17, 38			42	62			10
2	Control of development around and in APDs	11, 16		55	42				4
21	Infrastructure supporting farming operations (i.e. feed stores, processing capabilities, disposal for dead animals, bale plastic/twine recycling)	85		55	53, 56	60			5

Major Theme Code	Response Themes	Survey Responses							Total
		Snoqualmie	Sammamish	Enumclaw	Lower Green	Upper Green	Vashon	NA	
18	Technical, scientific, and educational support and education from King County and other agencies (some responses noted “continued” support). Specific examples included education for new farmers, efforts being regionally sensitive and developing/implementing farm plans).	7, 40, 51, 74, 80		49	41, 43, 53		92, 94	26, 32, 35, 37, 50, 75, 97	17
17	County prioritize rural interests. This includes the promotion/marketing of local farming, public awareness of farming.	5, 13, 95		55	53			26, 34, 58	8
7	Inclusion and support of horse interests in agriculture programming							29, 70	2
	“Legal productive workers”							32	1
7	Opposition to horse interests in agriculture	90							1
	Eliminate “wasteful government spending”			79					1
	Improve Federal subsidies- subsidize all farmers	99							1

Question #16: What are the trends you think are important to your operation and your industry?

(70 responses of 89 surveys)

Appendix F: Survey Responses to Questions #14-18

The following tables categorize the all survey responses for each of the five open-ended survey questions (i.e. #14-18). The “APD” column represents where the survey respondent farms. The response rate note in the “Response” column is the percent of surveys of the 89 surveys that responded to that question.

Question#14: How is your farm operation changing?

ID	APD	Response (N=77, 87% response rate)
2	Snoqualmie	way too much sediment setting on property from upstream erosion
4	Snoqualmie	complexities of regulations of farming along shorelines of rivers and streams
5	Snoqualmie	moving from wholesale to direct marketing
6	Snoqualmie	We are growing. We have the capacity to deliver bigger and bigger quantities of quality, local produce to the community. But flooding, in my opinion in part due to development and tight lining upstream are making our beautiful, fertile valley more and more difficult to farm in. But we are going to stay!
7	Snoqualmie	Attempts to capture more value-added \$. Diversifying/vertically integrate.
8	Snoqualmie	More difficult to grow crops because of drainage.
10	Snoqualmie	Necessity for year round production, facilities in floodplain without devastation and planning for this. Storage crops for year round sales not able to bank on crops growing fields due to "flood contamination."
11	Snoqualmie	The season for growing is shortening. The cost for flood recovery is rising. The need for structures and pads to raise equipment is becoming required rather than optional.
12	Snoqualmie	We are growing (we hope) to respond to ever-increasing demand for locally grown food by regular people, restaurants, etc.
13	Snoqualmie	Hard to grow, work and market to pay mortgage.
14	Snoqualmie	No longer able to grow over winter. Shortening our farmstand marketing season. Focusing on fewer and most profitable products.
15	Snoqualmie	Shorter selling season/ more concentrated sales season. Farm weddings.
16	Snoqualmie	Every year is a new experience, trying new techniques, learning from mistakes, talking to neighbors (farmers). Every year we are striving to add more infrastructure so that at some time in the future we can farm fulltime before we get too old and tired.
17	Snoqualmie	Trying to survive floods. Economic losses drastic.
20	Enumclaw	We are going backwards at this present time due to low milk pricing and high feed costs.

ID	APD	Response (N=77, 87% response rate)
21	Snoqualmie	The flooding is impacting us more and more every year, beaver issues, longer times getting out on the fields in spring, wetter in fall. We are experiencing more floods per year, and larger flooding than we used to. Have been impacted by flooding more often now in spring time during calving season. Maybe forced to switch from cow/calf raising our own animals to only being able to buy yearlings and have nothing during the winter due to impacts from flooding. This is not something our customers want to do as it's difficult to find grass-fed yearlings to buy. We've also recently noticed it more and more difficult to get all the hay in we need due to weather and likely will need to change to making more haulage and less hay. It is harder to sell, but we do like to as a more optimal feed for cattle. However we have to hire it made as we have equipment for small bales and not the big round bales so it's more expensive. I'd like to hear what others think the reason behind this are: climate change? Global warming? The fact we don't clean rivers out anymore? Development" and what are the trends looking like? Are we just experiencing a phase or is it going to continue to get worse and do we need to change our operation?
22	Enumclaw	Urbanization. Can no longer cover cost of doing business.
23	Vashon	As more people become more aware of where their food comes from, we have a growing demand for product.
26	Snoqualmie	Oak Hills Vegetable Farms was started by my parents in 1952. It was farmed until 2000 in the Roy area of Pierce County. Urban development made it impossible to continue at that site. We follow the political area closely. We were given a good 10 year head start to development plans. We either move to another location or stop. We decided to sell the property off in 5 acre parcels. Place important language into the contracts concerning farming practices. We protect trees, hills and land with attorneys. It worked well and moved on. We took several years off and began planning. We have planted into several areas and now are getting ready to open a new site in King County. Company press release in February 2009. My father and mother, Richard H. and Florence Wheeler are the founders of the Olympia Farmers Market. We are still involved in 6 farmers markets. The farming practice is still the same for us today as it was in 1952. Except we do not use the amount of chicken fertilizer we did in Roy from Wilcox farms. Bottom line is this. If you are not willing to make farming a way of life, you will never stay successful with commercial or small lot farming. It is blood, sweat and tears. But its rewards can be big. When times are tough, the farming minds kick into high gear! See you at all the meetings.
29	NonAPD	Less monies available for environmental education means more emphasis for me on making money from horse camps, clinics, boarding, trail rides, etc.
30	Enumclaw	hard to find farm labor. Too many people don't want to work.
31	No response	it's not tho it is becoming more profitable
32	No response	more higher value crops with greater emphasis on marketing, merchandising, value added and consumer ready products and a diversification of market segments, diversification of crops and selling the farm experience
34	No response	I am a new farmer. I have been doing this for 3 years. My operation is growing.
35	No response	I like the fact that we now have a USDA mobile slaughter unit. That is better for animals. I don't like the fact that not enough people can raise hay or make silage.
36	No response	Changed from conventional to organic dairying
37	No response	it is not

ID	APD	Response (N=77, 87% response rate)
38	Snoqualmie	We just switched from horse grazing. These draft horses were for recreation (served a carriage business), though they were capable of horse farming (i.e. plow work, etc.).
40	Snoqualmie	getting wetter; plan on more cultivation of land
41	No response	It changes every year as we try and anticipate new items for market.
42	No response	my farm will change to a better farm if I can get solved my land problem.
43	Lower Green	We want to expand into other u-pick small fruits and crops and require 2 greenhouses to do salad greens and tomatoes. We want to go from part-time to full-time within the next 5-6 years.
45	Lower Green	?
46	No response	not much just gets bigger every year.
48	Vashon	Expanding.
49	Enumclaw	changing from haying to grazing
50	NonAPD	Have gone from traditional farming and the use of synthetic fertilizers & pesticides/herbicides to organic methods, including crop rotation, winter cover crops, natural pesticides, etc.
51	Snoqualmie	Our partner wants to sell their share, and we are trying to raise the funds needed to buy them out. We are planning to add new vegetable growing areas (high tunnels).Future plans include more blueberries, fruit trees, grapes and a small winery.
52	NonAPD	main problem is water
53	Lower Green	Due to limited acreage to lease the farm is shifting from perennial to more annual crops. Leased land in APD necessary for crop rotation was sold to developer.
54	Enumclaw	Growing by 50% this year.
55	Enumclaw	Spending too much money on feed and overall operation costs. Even though it's an ag prod district and development rights are sold, the affects of urban sprawl affect us and make farming difficult. Price of milk fluctuates too much. No concerted effort locally to do anything to preserve dairy farming, most of the focus is on small crop farmers.
56	Enumclaw	darigold controls the price of milk and we have to milk more cows to make ends meet, but more cows means more feed, more expense and more manure. we do not have the land available to spread manure anymore will all the parcels of land cut into small hobby farms. This also restricts us from producing local feed; it's not worth planting corn in a 5 acre parcel.
57	Enumclaw	I'm still developing.
58	NonAPD	High demand for local food and organics
60	Upper Green	more restrictions
61	Enumclaw	Growing smaller plants for limited size yards
62	Upper Green	I'm diversifying more so when I have a slow year selling livestock, hopefully the herbs and berries will sell and vice versa.
63	Enumclaw	more value added
65	Enumclaw	just growing bigger and better!
66	Enumclaw	It's harder and harder to lease other fields at a fair price now that the land is so valuable.
67	Enumclaw	Government control and restriction
69	No response	Looking at implementing more green practices.
70	No response	The economy downturn has effected the value of our product, (negatively), while at the same time costs have gone up (fuel, feed).
71	Snoqualmie	growing slowly very hard to do while working part-time, labor impossible to find or afford

ID	APD	Response (N=77, 87% response rate)
72	Sammamish	Becoming more intensive as well as gradually extending the seasons by growing in hoop houses.
73	Snoqualmie	We will be utilizing more of our land to meet the customer demand.
74	Snoqualmie	I am adding things as I learn things I add more and more. Our goal is to be as self sustaining as possible. I would like to learn how to rotate animals through a winter pasture and then grow grain on it. I am also trying to learn more about meat production for selling.
75	NonAPD	I operated our farm as a CSA for seven years, before my arthritis forced me to retire from growing food for sale. We have a large variety of children-friendly livestock and grow an abundance of crops so member families can have a monthly farm experience. As the weather seems to be shifting to colder springs, I am relieved to not be growing food for sale. We live in the foothills east of the Snoqualmie Valley and have a relatively shorter growing season.
76	Snoqualmie	We are trying very hard to expand our acreage under production, but are severely limited by access to water (need an ag well to bring new ground into use) and lack of buildings to store anything out of the rain. We feel there is an almost unlimited market for what we grow, but we are really struggling to expand our acreage because we have no infrastructure.
78	Lower Green	Transitioning to purchase and become fulltime operation, 100% of income within ten years
79	Enumclaw	My farm operation is changing daily.
80	Snoqualmie	Transitioning cows elsewhere so we can add more goats to our acreage. Recent flooding has really affected our pastures for grazing purposes.
81	Enumclaw	Due to economy I've rescued several horses bound for slaughter and now I'm overstocked.
82	Enumclaw	So far, I have not been impacted.
83	NonAPD	urban agriculture is growing
84	NonAPD	It really isn't except for more diversification into forest products and no more expansion in the nursery.
85	Snoqualmie	Expanding
87	NonAPD	more sustainability focused
90	Snoqualmie	We are a new farm, and we are trying to be both financially and environmentally sustainable. At this point, my belief is that environmental sustainability means that, at any given time, we need to have 2-3 times the acreage used for growing vegetables lying fallow under cover crop or pasturing ruminant animals. Because of the flooding, we are not in a position to achieve what is truly sustainable right now. However, we are constantly striving to achieve an acceptable level of soil health.
91	Snoqualmie	We run our farm using organic, biodynamic and permaculture methods. Our farm is always changing, quite literally...
92	Vashon	Trying to find non-traditional ways to get more land to use.
93	Vashon	becoming more profitable each year (14 years)
94	Vashon	Growing! Double the area for row crops additional 20% greenhouse space.
96	Snoqualmie	I have been contemplating expanding to a major showcase permaculture and biodynamic farm. Given the difficulties of dealing with King County, I am seriously contemplating selling of my 85 acres (currently 20 acre parcels), and moving to a county that is more friendly to farmers.
97	Vashon	changing that I have diversified my product

ID	APD	Response (N=77, 87% response rate)
98	NonAPD	cleaner
99	Snoqualmie	Feed is a lot more expensive and also property taxes. Last year the price for 700 to 800 hundred pound cattle was eighty some cents per pound. This is the same price as in the 1980's, yet alfalfa hay in the 1980's was 65 dollars per ton. Last year a ton of hay was nearly two hundred dollars. In Western Washington a cow raising a calf and the calf will consume three tons of hay per year with six months of pasture.

Question#15: What kinds of resources or services do you need to be a successful farmer in the future?

ID	APD	Response (N=71, 80% response rate)
2	Snoqualmie	resources to ag community
3	Snoqualmie	easier, more streamlined, and less expensive well digging and building permitting process
4	Snoqualmie	simpler solutions and permits for replacing a culvert with a bridge for fish safety over a stream to get equipment from one field to another. This should not be so complicated.
5	Snoqualmie	marketing assistance, rebuilding of infrastructure (processing services, etc) permit assistance, regulatory relief. <u>Flood relief.</u>
6	Snoqualmie	Let us put the infrastructure in that we need!
7	Snoqualmie	Irrigation ponds- esp. integrated into current wetlands. Support with other County departments: transportation-- runoff; Health dept: process facilities permit/technical assistance DDES: clearing/drainage- creek clean out (creeks like ditches silt in) FPP on-farm processing at reasonable cost. Need protection from upland development runoff.Drainage help-drain tile install and maintenance.
8	Snoqualmie	Make permit process faster. Help us with ditching. Dam on Middle Fork Snoqualmie.
10	Snoqualmie	Farm worker housing, legislative push through with less fees, less time and less permitting of land use attorney fees, farm buildings. Ability to create heightened land/dykes to protect existing fields and buildings. Flood and drop insurance for multifaceted compounds and diverse crop productions.
11	Snoqualmie	We need DDES/gov reps who can take us through the building/pad process and a lower fee schedule for permits. Control development above the valley floor. Control of clearing above and around the APD.
12	Snoqualmie	Farm worker housing, wells to bring new ground into production, flood protection
13	Snoqualmie	Easier way to get things to sellers. Hard to find outlets, sometimes very picky and hard to work with.
16	Snoqualmie	It is recognized that urban development is slow at this time; however I respectfully request that the County consider doubling the TDR credit.
17	Snoqualmie	A dam. It would also be nice to have the dairy industry back in King County. It has the perfect weather conditions and pastures for milk production. Milk is more flavorful when cows are let out to pasture. Also more profitable.
20	Enumclaw	A methane digester and more land.

ID	APD	Response (N=71, 80% response rate)
21	Snoqualmie	The Snoqualmie Valley is not located in a great area to be able to access any mobile units. Tho there are such in Skagit and Pierce, I have been told the Skagit unit won't come down this far (as well as the co-op is full) and I find it hard to believed we'd be able to schedule the Pierce unit. Nor do I want to really deal with anything that far away and trust the scheduling would work out. I know you can sign on early to almost guarantee use, but not sure it's still worth it and it's still not clear to me how the cut/wrap would work. I'm not interested on have the time to deal with sending folks down south to pick up their orders or doing any deliveries. Also, if the flooding/weather calms down and we don't keep having increasing floods we'd continue as we today and would be fine with our current operation.
22	Enumclaw	Lower taxes. Lower payroll taxes. Lower property taxes. Higher ag product prices.
23	Vashon	We need major mud management/ winter water drainage systems as we are in a valley on Vashon Island. We need much more than \$5,000 match from KingConservation.We need a bigger barn to accommodate more feed, cure and store more produce, and to eliminate the many roof lines from little sheds draining water into our pasture.King County permit process is prohibitively expensive and cumbersome. Why will it require a septic review to build a barn? The cost of permit will make the cost of barn construction out of reach for us.A barn will also allow us to offer off season/ on site workshops and classes, which will potentially offer additional farm income, making it possible to make a living on the farm.
24	NonAPD	Need to make it easier to have accessory uses to small farms like retailing, processing, and even unrelated activities that will bring the public to our small farms.
26	Snoqualmie	Soil that is not diseased from improper growing.
28	NonAPD	more land
29	NonAPD	Support for horse raising & keeping in King County.
30	Enumclaw	The biggest challenge with King County is that it is too hard to get permits. They cost too much and take too long to get. We need more cost share and incentives, not more regulations. It is very difficult to develop a farm under the current system. I had to designate my entire farm as a wetland just to get a permit to renovate a barn that was falling down. I need more and better cost share. It takes 90 - 100 days for King County to give me a check. It takes the Feds 2 weeks. The County needs to be more efficient with this.
31	No response	nothing - it's all right here in king co and plenty of land to be successful (well okay maybe more sun so that I can grow better toms)
32	No response	reduced time spent on government interface... more freedom to operate/ less management time and money devoted to regulations as this does not pay one bill. Paying bills and generating profits are generated by sales of goods and services to a diversified customer base seeking high quality products or farm experiences.Needed (not in any order): (a) more time free of government regulations, (b) promotion of farm and product awareness, (c) money/grants and low interest loans, (d) good quality people to be forward thinking and creative as part of the team including employees, lenders, government agencies/agents ... all with a can do attitude!, (e) a reliable source of legal irrigation water, and (f) reliable source of legal productive workers

ID	APD	Response (N=71, 80% response rate)
34	No response	I need a customer base that can afford to purchase relatively expensive products. I need to be able to have buildings to support my farm activities. I need to be able to change my operations to suit the market -- different animals, different practices, and different crops. I need to be able to live on or near my operation, or to grow my operation large enough to hire someone to live on or near my operation. I need a small slaughterhouse that will allow me to slaughter animals that are USDA inspected within a 2 hour drive of my operation.
35	No response	We need to rethink the idea of dairy farming to make it more profitable for the FARMER! Try ideas like they have in France. Let the farmer make a buck instead of the middle man. There are too many middle men with their hands out in both the meat and dairy industry. Common sense would fix this whole situation. In France it is perfectly legal for the farmer to sell what he or she produces off his or her own farm. We need grants and lending for young people to get into farming.
36	No response	Control the change in land use so that agriculture can continue and to reduce nuisance complaints. No limits on size of agriculture building. Easier and less cost for permitting. Relaxed regulations on Development properties to accommodate changes in farming. Farm housing for employees and retirees allow for sharing of manure for digester projects. Realistic evaluation for land values for farming on Development Right lands.
37	No response	Access to quality technical and scientific support, a good network of farming groups. A voice in the community. The ag commission and King CD as well as the King county ag programs have become too political and bureaucratic. The folks at the King county conservation district are not very technically astute in the science of agriculture. The workshops and plans are very much the same as they were 10 years ago and are repetitious and not geared towards crops farmers or crop science, WSU extension is more appropriate in some ways.
38	Snoqualmie	Need to install a bridge of some type over a salmon-bearing creek in order to access another 20-30 acres of farmable land adjacent to a creek restoration project. Also need to be allowed by zoning to repurpose dairy barns located on RA-10 lot away from livestock uses to storage/business uses. As mentioned above, these barns are close (30 feet) to creek and highway 203, and not appropriated to livestock (in order to prevent water pollution and collisions), and yet this is the use the county zoning enforcement officers are encouraging for us. What we need is to be able to rent surplus barn space to others in order to support these historic buildings and preserve them for future ag. uses. Otherwise they will just fall apart since we don't have the money to maintain them under the current zoning rules. Reduced flooding will also be necessary for continued successful farming here. The increased intensity and frequency of flooding recently is proving damaging to crops. My guess is that development on the upland parts of the Snoqualmie Valley is contributing to the flooding trends. Additionally, the mapping of floodway versus floodplain appears to be inaccurate and thus overly restrictive on our property. For example, drilling a well would be useful for our ag. uses and it would be allowed if our observed patterns of flood movement were reflected in the classification of the floodway versus floodplain. We need a realistic way to appeal this classification and get permission for a well for irrigation.
40	Snoqualmie	Continued support of current program
41	No response	Continued expansion of WSU classes, etc.
42	No response	We need the KC to clean up the street ditch every year. Due to the water flood from the ditch of the street and back up to our property and stop the neighbor that doing their illegal operation.

ID	APD	Response (N=71, 80% response rate)
43	Lower Green	Extension services, a loan to buy land.
45	Lower Green	security of land lease
48	Vashon	Economic recovery to help sustain market.
49	Enumclaw	support
50	NonAPD	Having more productive land available to grow crops & livestock. Also support by our agricultural agencies/resources to encourage new people to get into farming & marketing our products locally. Stop taxing small farms out of the business and encourage more organic ag-businesses.
51	Snoqualmie	More educational seminars and workshops. Land, building, and equipment financing to buy out our partner and pay for planned changes. Help with grant & subsidy requests.
52	NonAPD	water
53	Lower Green	The future is with the younger generation. More training, economic and technical support relevant to regional forms of agriculture are badly needed. Regeneration of the agriculture infrastructure will help younger/new farmers to succeed. County government has to re-focus from urban/environmental issues to rural/agricultural issues in order for agriculture to survive.
54	Enumclaw	The ability to maintain my land quickly and efficiently by being able to clear and grade and manage flood water without having to go through the permitting process.
55	Enumclaw	Restrict building in rural areas. develop a local market for milk that will work. If we got more for our milk we could have less cows, less manure and less pollution problems.
56	Enumclaw	local place to sell milk, development of a local milk, cheese or yogurt outlet that we can ship milk to that will sell as local produce. if we can supply and process in the Enumclaw area we can maybe reduce the numbers of cows we have to milk to break even. A local marketing strategy for manure related products.
58	NonAPD	Puget Sound Fresh and Cascade Harvest Coalition
60	Upper Green	need disposal for dead animals; need disposal for recycle stuff; cleaning existing ditches on plateau
61	Enumclaw	when the county buys ag products contact the APD growers about selling their commodities
62	Upper Green	Fix the cam so we don't float away!
67	Enumclaw	County and State to stop changing laws and restrictions all the time
69	No response	It depends on whose idea of successful I use. If it is the county it may mean I bring additional revenue and follow all the requirements provided now and in the future. If it's my idea of successful it means I produce a product which others buy and I can afford to stay on the farm.
70	No response	Tax incentives, promotion programs
71	Snoqualmie	More land...affordable
72	Sammamish	Not having houses or warehouses built on farm land. Access to water and the ability to control water run off in areas where the water table is close to the surface in the spring (that is, all that fertile soil that was once a lake bed after the retreat of the glaciers from the last ice age, i.e., the Sammamish and Snoqualmie Valleys).
74	Snoqualmie	Mobile meat slaughter and packing (USDA if possible), relax restrictions on commercial kitchens for farmers, keep organic farming legal and affordable--lots of legislation out there making it harder--I would get certified organic except for the price. It would also be helpful if you did more teaching about marketing. Also, I would like to be able to teach sustainability classes.

ID	APD	Response (N=71, 80% response rate)
75	NonAPD	Better weather would help. I could use some help with marketing our unique form of membership farm.
76	Snoqualmie	We will need:- water for irrigation- housing for seasonal workers (and ourselves!!)- storage facilities for tractors, tools, seed, etc.- affordable land so we can own our own farm rather than lease.
78	Lower Green	Availability of affordable farmland close to market
79	Enumclaw	The elimination of wasteful government spending would be a great start if you are asking what resources and conditions I need from King County to be increasingly successful.
80	Snoqualmie	Help with farm plan. I signed the agreement two years ago and still waiting for a plan.
81	Enumclaw	Keep horses in farm category
84	NonAPD	Simplified permitting to allow a farmer to take quick advantage of extra time and money that may not be there by the time permit is issued. Lower permit fees, increased site specific flexibility and much better communication and competency from permitting agency.
85	Snoqualmie	Continued cooperators with small fruit/berry farms
87	NonAPD	healthy agricultural economy
90	Snoqualmie	Successful farming in the Snoqualmie Valley requires both nothing and everything. Currently, my farm leases land from a local landowner. Zoning codes and building restrictions mean that I have to commute to my farm. Being a commuter farmer is fine, but it makes raising livestock (necessary, in my opinion, for true sustainability) near impossible. Allowing farmers to construct permanent living quarters in the valley opens a dangerous can of worms, because non-farmers with money (i.e. equestrian enthusiasts) will surely exploit any regulation that permits, for instance, ag-related structures, dwellings, etc. The problem in the Snoq. Valley is that all the infrastructure farmers are currently using was built back in the dairy farming days, when the farms were 3-400 acres. Now, much of that land has been subdivided, with what seems like mainly equestrian properties occupying the homes and barns, and people like me renting the land that has nothing on it. If real farming is going to happen in the APD (like it should, given the title APD), laws, rules, regulations, etc must be written to ensure that real farmers can live and thrive on their land. When I say "real farmers" I mean farmers who grow or raise a product for humans to eat. Horse boarding, raising hay for horses to eat, shooting clubs, golf courses, sod operations, etc are not "real farmers."
91	Snoqualmie	We need a more cohesive permitting process, especially as it pertains to farm pads and ag buildings.
92	Vashon	business loan, planning loans, product liability/value added food products insurance
93	Vashon	-haven't asked for help thus far. Would like to see a "farms -to-school" with produce on Vashon Island.
94	Vashon	Don't let the gravel mine (Glacier, NW on Maury Island) ruin our aquifer. Farmers markets in small communities need some help with product liability insurance - especially for small businesses, and prepared foods/value added- This insurance can be prohibitively expensive; leaves small farmers markets exposed to frivolous lawsuits, or forced to turn away small producers.
95	Snoqualmie	More support from County and State regulators making it clear that farming is a valuable pursuit in this area. Today we are treated like a nuisance.

Question#16: What are the trends you think are important to your operation and your industry?

ID	APD	Response (N=70, 79% response rate)
2	Snoqualmie	organic, local, slow-food, food safety
3	Snoqualmie	the local food movement
4	Snoqualmie	For the government to streamline its interstation of communication so the farmers doesn't lose so much production time dealing with the government complexities.
5	Snoqualmie	move to direct marketing. Smaller more intensive farming.
6	Snoqualmie	Give schools and government institutions more funding to purchase quality, healthy, local food products. Products that improve you health and your mind. Local growers can't sell their product at cheap industrial prices.
7	Snoqualmie	People want local/organic food- but they'll still only pay so much for it and we can raise only so much of it. --value-added/opportunities needed for farmers. People will pay more for entertainment/rural/farm atmosphere for conferences, weddings, dinners, pumpkin/wagon rides-- maybe these can be integrated into farms, but they should not displace farms and should be carefully planned on a community level.
8	Snoqualmie	More often flooding. Less restrictions on critter pads. More flexible employee housing.
10	Snoqualmie	Continuation of farm to food programs. Continued county support treating farm land differently than urban or rural residential land. Insightful looks at what do for riverbed/ damming/ bank runoff. Stop Snoqualmie River from being dumping ground for developments.
11	Snoqualmie	Ever rising floods. Development around APD.
13	Snoqualmie	Eat local, buy local
14	Snoqualmie	Locally grown movement. Safe food movement. Support your community movement.
15	Snoqualmie	Stable population. Buying local.
16	Snoqualmie	Trends are working favor of small farmers. However, the County needs to be more flexible with temp worker housing, offices in barns, ag structures on farm pads.
17	Snoqualmie	To have federal, state, county and city voters understand the complexities of farming in an over regulated and ignorant government policies that hinder rather than assist agriculture. Example: Gove Dan Evans vetoing dam construction in 1975.
21	Snoqualmie	Trends we're seeing with weather changes are the biggest for us. Also, urban interests in buying local is what's keeping us in business. Continued education, especially in our youth and increases in education all both urban and rural since many of the rural kids now are from urban parents. Increased cooperation between ag/county had been very beneficial to both of us.
23	Vashon	The biggest and most obvious trend is public awareness, desire and appreciation for the source of their food. People either want to learn how to grow more of their own food or know their local farmers and farmer markets.
24	NonAPD	local, organic, specialty farmer's market type crops, public interest in small farms.
26	Snoqualmie	New people will enter the agricultural fields. Due to the economic earthquake we are having in the US. The best thing in the world is tough times. It causes you to think. How can I stay alive!

ID	APD	Response (N=70, 79% response rate)
28	NonAPD	interest in local products is on the upswing --this is very, very good
29	NonAPD	I think that more people will be boarding their horses "at home" to save on the cost of commercial boarding facilities. That means potentially more environmental impacts (mud, manure, over-grazed pastures, etc.) as well as more people interested in how to properly manage livestock on small acreage.
30	Enumclaw	People need to use more local products. We need to even the marketing playing field. It's too easy for Canada to bring sell their products here.
31	No response	organic, no impacts on environment from chems and other types
32	No response	My farming is a diversified integrated farm with growing, packing, sales and distribution in three counties but King county is the most difficult to operate because of the amount of time, effort and money it takes in dealing with the bureaucrats. So for me to be successful I need the ability to move quickly to take advantage of market opportunities... including change of crops and change of methods of farming... so this means regulatory flexibility or changes and the capital to complete the task. The capital comes in the form of money, equipment, personnel, and personal time but if the regulatory burden is too great then the rest will not matter because it can't get done when needed.
34	No response	Land is being cut into increasingly smaller chunks. No one will ever put together large parcels for agriculture, so the trend will be to have smaller and smaller chunk of land and smaller and smaller farms in the urban areas. In eastern Washington it is popular when land is subdivided to add CC&Rs (covenants, conditions and restrictions) that basically outlaw certain agricultural activities in land otherwise zoned agricultural. I need land that has reasonable clear boundaries on its use --- the base county zoning, for instance --and I need my neighbors to not be able to control what I do on my land. I will respond to the market, but I need the flexibility to do things that are common/good/best practice without fear of neighbors being able to block or interfere. King counties current setback requirements for pigs to be 90' from property lines means that you cannot keep pigs on lots less than an acre wide, or smaller than an acre in general. Remember that farms will be getting smaller and smaller as time goes by. Setback will gradually eliminate pigs from the possible farms in King County. Pigs particular are known as "mortgage lifters" -- they are livestock that are a proven winner for urban markets. King County is hostile to small pig farmers.
35	No response	The biggest one is the slow and sustainable food and clothing movement.
36	No response	Producing and consuming more local foods.
37	No response	Sustainable development, local markets, more innovative ways of doing business
38	Snoqualmie	Increased interest in locally produced food and better access to markets for these products. Also increased interest in and prioritization of environmental protection, which is also important but at conflict often with agricultural uses. Would like to see a more case-by-base-oriented balance of these competing priorities.
40	Snoqualmie	Continued promotion and education of the public as to the importance of local farms.
41	No response	Not enough west side farmers for the number farmer markets.
43	Lower Green	Local food awareness, the slow food movement, public education and interest in keeping out food and farms here and healthy
45	Lower Green	buy local, farming without chemicals
46	No response	smaller growers having a market.
48	Vashon	Local and organic food movement expansion.
49	Enumclaw	horse boarding, training

ID	APD	Response (N=70, 79% response rate)
50	NonAPD	King County in cooperation with local business could show a greater encouragement of the smaller/family owned farms. We need to continue the education of future farmers and support the farms in producing a greater diversity of crops and sustainable practices. Support supplementary co-operation between local farms, governmental agencies, educational institutions and businesses such as restaurants, markets, grocery stores to work together to support the local agricultural economy.
51	Snoqualmie	Locally grown food, organic production and customer education of on farm food production systems. Hands on opportunities for interested volunteers. Agritourism and local school tours.
52	NonAPD	changing technology
53	Lower Green	Increasing opportunities for direct marketing. Increased interest in locally grown farm products. Increased interest in organically grown products. Increase in permitted agriculture related activities on farm. Loss of infrastructure and rising costs. Increasing burden of environmental and ESA regulations. Decreasing availability and increasing cost of farmland. Increasing incompatible land-use in and around Ag districts.
54	Enumclaw	Give back control of land management to the individual landowners and reduce the bureaucracy in government /environmental regulations so that we can make a profit!
56	Enumclaw	development of a local niche, just like the beef/pork/lamb producers who can sell off the farm and get a decent price for their produce. We are been encouraged or forced to take a buy out just to get rid of milk off the market. It's a tiny band aid on a large wound.
58	NonAPD	marketing, buy local
60	Upper Green	lack of anyone who want to labor on a farm
61	Enumclaw	keep ag subsidies. Keep Puget Sound Fresh.
62	Upper Green	Internet- people shop and research farms that way.
64	Enumclaw	responsible breeding - rescue
67	Enumclaw	Marketing/ sales prarlion (sp?)
70	No response	Horses need to be considered livestock, and raising and selling them considered commercial agriculture.
71	Snoqualmie	Buy local
72	Sammamish	Direct to consumer and restaurant sales. Zoning that recognizes the importance of having farm land near population centers.
74	Snoqualmie	LOCAL sales Local food. Teach people how to be more sustainable themselves. Organics...biodynamics.
75	NonAPD	As a member of Sno-Valley Tilth, I strongly endorse the Policy Statement submitted by our organization. I think it is imperative to define agriculture as "food for people" and act swiftly and strongly to ensure a local food supply for King County. I was born here, fell in love with local farmland as a child, and support ALL efforts to protect farmland for farming.
76	Snoqualmie	Tons of support for sustainable local food from our friends in the cities. People are also taking a closer look at farming practices rather than just accepting that certified "organic" is be-all and end-all. Thoughtful farmers who constantly question their assumptions about sustainability and always aim to do better will have the most credibility with the public as people become more educated about the sources of the food they eat.
78	Lower Green	Organic, local, nontraditional markets (CSAs, restaurant partnerships, on farm events and marketing)

ID	APD	Response (N=70, 79% response rate)
79	Enumclaw	Cutting out the BS and having a direct relationship with customers. Also, trends aren't important. Trends are fleeting.
80	Snoqualmie	Consumer awareness on the importance of buying local.
81	Enumclaw	Constant encroachment by government, development
82	Enumclaw	Farm Plans are important as well as livestock (i.e. Cattle & horses)management

Question#17: What are your plans for your farm property in the future?

ID	APD	Response (N=73, 82% response rate)
2	Snoqualmie	same- no change
3	Snoqualmie	keep growing veggies... if permitting, zoning allows, perhaps a small, once a week farm-fresh restaurant
4	Snoqualmie	poss. Nature conservancy
5	Snoqualmie	continue to do dairy and hopefully process our own milk to add value to our products.
6	Snoqualmie	We are going to keep farming.
7	Snoqualmie	We want to keep growing organic food.
8	Snoqualmie	Expanding as land becoming available.
10	Snoqualmie	To continue farming organic produce while increasing educational opportunities to promote environment and sustainable agriculture.
11	Snoqualmie	To build a home and barn and pad.
12	Snoqualmie	We'd like to bring currently fallow land into production, but we need water (ag well).
13	Snoqualmie	Increased # of greenhouses
14	Snoqualmie	Continue growing food?
15	Snoqualmie	Possible partnering with daughter and son in law
16	Snoqualmie	We want to complete some improvements wherein we can move to and live at the farm. Planning on putting another 5 acres into production this year. We will need to replace our pump house and well components after the January flood.
17	Snoqualmie	Hopefully to continue farming in a lesson flooding situation. We have the best temperatures for crop production but do not do well under water.
20	Enumclaw	Hopefully if we are still in business to have digester put in and milk more cows.
21	Snoqualmie	This is a big unknown for us. Mostly due to the price of land in King County has made it difficult for us to purchase a large piece of property, even in it's located in the flood plain. And, as mentioned above, if we have to change to a seasonal operation due to weather/flood issues we will have change our marketing and/or risk losing clients that want animals born/raised all on the same farm. The bottom line is it depends, if the flooding continues to get worse, we may just quit farming. We could switch to haying/haylage only operation but that's not as profitable nor something we'd really enjoy. The increased costs the last couple years in having to rebuild fences more often, hire crews, and costs for cleaning up everyone else's garbage that comes in all adds to the bottom line. Maybe possibly sell and move to a different climate.
22	Enumclaw	To be able to afford to keep the land whole. Farm/Park/Lease
23	Vashon	Barn; In season workshops and classes; Teaching tours; off season workshops and classes; Food service awareness training; Farm/chef connection

ID	APD	Response (N=73, 82% response rate)
24	NonAPD	On my 7 acres I plan to continue to grow hay and pasture my animals. The property is zoned R4; I would be interested in exploring options to reduce my taxes. We also own an additional 14 acres zoned RA5 nearby. We would be interested in having someone farm this more intensively.
26	Snoqualmie	We will be preparing for the next generation of Wheelers to start farming. Once they go through proper training.
28	NonAPD	I hope to farm it until retirement, I hope my son will want to continue to farm it
29	NonAPD	see question #14
30	Enumclaw	I plan to renovate my barn to double the size of my furrowing operation. County regs make it difficult to expand and it's too expensive. All I want to do is to tear down a building that is falling down and replace it. It's taken months to get a permit for a roof on a manure storage facility. I have spent over \$700 for this to date. I want to build a small shop but can't because of septic issues even though I don't plan to have any plumbing in the building.
31	No response	same as is
32	No response	The plan in 2009 and 2010 is to farm organic green beans but beyond this it will depend on what can be done to the land to make is usable for other vegetable crops of specialty crops. For example can I ditch, dike, contour, level, etc for nursery crops, cranberries, blueberries, high value veg. etc because if not then I may be limited in what can be done with the land to keep the farm viable. Currently I must grow something that is a very quick/short season crop to mature like green beans because to the drainage issues and the restrictions put on cleaning ditches by the county/state (these are causing me to be disadvantaged compared to other counties). I would like to devise a longer term plan but cannot do that very well because the county/state one or both does not seem to care about the costs of the regulations that are imposed on the farm operation. I would invite a solution of setting out the objectives to be accomplished with the various agencies and if there is great degree of flexibility of implementing then this would be good for the farmer rather than imposing a strict set of rules and processes that must be followed even if they do not make much sense. (back to cleaning the ditch... if the water does not leave the property during the cleaning then why does it have to be pumped around the dredge point? ...in Skagit and Snohomish county this procedure is not implemented even if the water does leave the property during the dredging.)
34	No response	I am buying land in counties other than King to sell to consumers based mostly in King County. I would much rather operate and sell in the same county, but the current King county land use regime makes this impossible. I operate a blog at ebeyfarm.blogspot.com you are welcome to look at my operation and comment there.
35	No response	Keep going, teach interns how to raise sheep on browse. Get more land. I need help with getting more land. We are a non-profit and teach sustainable and slow food and clothing.
36	No response	We are hopeful that our dairy will continue onto the next generation. If not the next generation we would like to have the dairy continue.
37	No response	I am thinking of moving to Skagit County.

ID	APD	Response (N=73, 82% response rate)
38	Snoqualmie	We'd like to be able to use the non-farmable upland parts of the farm property for a small special-events venue in order to support the farmable sections in the valley (also a zoning issue). We do have 20-30 unfarmed acres that we'd like to make available (mentioned above - needs a bridge) either for us or for another for more farming. Would love to rent this part to an organic farmer.
40	Snoqualmie	Continued use of farm as a farm. I also keep 8 horses as part of Children's Hospital summer camp (35 yr volunteer). The horses are a vital part of 2 other camps (Special Care, Rise in Shine). The farm has been certified salmon safe which means that the management practices are enhancing the salmon stream (#2 salmonid). All manure is composted either in bins or field and cultivated by the Hmong farmers.
41	No response	I'm 78, my wife is 76 - would like to continue for 10 more years and see to a young couple who would continue to farm.
42	No response	I will keep my land for my family farming for the future.
43	Lower Green	I hope to buy the land we are on now and continue to expand and diversify our operations to be sustainable and less risky and variable in the income department. We are also interested in improvements to the building including a commercial kitchen.
45	Lower Green	We want to buy the farm we have been renting for 10 years.
48	Vashon	Continue small farm egg production/sales.
49	Enumclaw	horse boarding and training raising of horses, possible breeding, only if colt turns out like his breeding.
50	NonAPD	To continue best organic practices possible and to educate others in how it is done. To work with others who may not have farms to show them how they can do things to support the greater good of the industry. To educate others regarding smart shopping practices and purchasing agricultural products locally. I intend to continue my education in organic practices and marketing and to stay up to date with what is going on in the agricultural industry.
51	Snoqualmie	The current plan is to transfer farm ownership to my daughter and son in law. They both currently work on the farm part-time and have a strong desire to continue the family tradition.They would be the fourth generation to farm this property.
52	NonAPD	none
53	Lower Green	Transitioning farm to younger generation.Exploring new fruit and veg crops. Exploring value added possibilities.Exploring new market possibilities - restaurant, farmers markets, web. Considering landmarking property and shifting to ag-tourism format.
54	Enumclaw	Continue to raise beef and chickens and other personal produce for ourselves and our friends. We would also LOVE to put a pond in so that we could raise fish as well but haven't even considered asking the county about how to do that for fear of being singled out and regulated to death!
55	Enumclaw	to try and stay in business
56	Enumclaw	I don't know, as it stands now it does not look good, we are hopeful that the manure digester will put some new life into the industry and help us out in some way, but not sure how.
58	NonAPD	Keep on farming and selling local
60	Upper Green	possibly
62	Upper Green	Continue current operations- keep learning and getting better at it
64	Enumclaw	continue to raise horses
65	Enumclaw	In 20 years (when retire) will sell to someone who wants to farm.

ID	APD	Response (N=73, 82% response rate)
67	Enumclaw	Would like to keep and raise cattle 20 years.
68	Enumclaw	losing land to development.
69	No response	Continue to raise a small heard of Friesian horses. Small enough to sustain them during the summer months on the grass I grow.
70	No response	Reduce number of livestock until market improves.
71	Snoqualmie	Add more greenhouses
74	Snoqualmie	Keep learning and growing... :)
75	NonAPD	Unsure. We continue to consider models for sharing our lovely land with others. Most of our property (90%) is in natural vegetation - we farm on less than one acre. We will continue to grow food and livestock, but beyond that, we aren't sure.
76	Snoqualmie	That depends - see comments above.
78	Lower Green	Continue farming, eventually create bed & breakfast and develop on-premises community and university education opportunities - seminars and internships
79	Enumclaw	Farming
80	Snoqualmie	Continue to grow our dairy goat herd. Purchase cow's milk from other local dairies in the valley.
81	Enumclaw	same
82	Enumclaw	I will continue to produce hay and board horses.
84	NonAPD	Limited expansion and few improvements. We are where we want to be. No plans for retirement but at some point may rent out nursery or sell property to enable us to retire. Will probably move out of W. Washington to area with lower costs and less urban environment.
87	NonAPD	Keep growing food for our family
90	Snoqualmie	Due to the high price of homes on acreage in the APD and the restrictive building codes (appropriately so without regulations ensuring that only real farmers may build), I plan on continuing to lease land in the APD to farm and keep commuting there from the city. Because I do not own my land, I have no real plans for any of the major improvements needed to turn my small vegetable farm into a larger operation.
91	Snoqualmie	We are working with Salmon Safe and King Conservation. We'd like to bring in native plants and also do small orchard work.
92	Vashon	intensive, small scale food production
93	Vashon	We are both 38 years old and plan to farm until we die.
94	Vashon	More intensive use of the land.
95	Snoqualmie	No plans with flooding and no recourse to solving the problem.
96	Snoqualmie	I am either going to sell my property off as 4estate sized lots, given that I am only 15 minutes to Microsoft. I would rather create a world class demonstration farm, with a conference center on my rural zoned piece, but I keep thinking about 21 acres, and other projects in my area. I have been told by most of the developers of large scale projects in King County that they will never do another project in King County. I think of Ken Bering who said that over 10 years ago. And these people stood to make large profits. Why should a farmer, looking to make a much smaller profit go through the same aggravation?
97	Vashon	Don't know
99	Snoqualmie	Wanted to farm as long as I was able and not giving up to much of my pension to make the farm work.

Question#18: What concerns do you have regarding farming in King County?

ID	APD	Response (N=67, 75% response rate)
2	Snoqualmie	More competition for land, its use especially from non-farm uses. Lack of flexibility as land owner to deal with everyday issues as farmer. Permitting quagmire.
3	Snoqualmie	Development and logging = bigger floods. Horse farms = more expensive farmland. Inconsistent enforcement of building and zoning codes = only the rich and the scofflaws get to build. Not enough farmers in general to meet demand in our region.
5	Snoqualmie	Loss of infrastructure assisting farmers within the county. Loss of staff assistance. Heavy weight of "fish concerns" us. Other viable land uses. Flooding and its impact on the farms/farm infrastructures. Farms and residents are more important than the sacred "FEMA Flood Insurance Rates."
6	Snoqualmie	Land prices. Over -development on the hillsides and ridges above the farming valleys which is making the flooding worse. FLOODING! (I'm on the Snoqualmie River.)
7	Snoqualmie	Over-development/illegal development--changing the use of ag lands and leading to over-valuation and underutilization as food farms (such as camp, conference/wedding facilities, horses, wineries). Would like to see a states focus on food/forage farming and programs actively supporting that and discouraging other. Farming is not a high \$ business, yet farmers are paying full price for land (even FPP land), septic systems, permits, structures. Consider "flood-appropriate farming" in the flood areas? Maybe animal operations and perennial crops should not be in the flood zone.
8	Snoqualmie	Will we be able to adapt to environmental change? Can I get help to drain my land?
10	Snoqualmie	How can we deal with the floods, limited operation with spring floods and early fall floods. Expenses of facilities, labor, materials, dumping and clean up. Lost products to sell at increases labor and infrastructure expenses aren't going to work.
11	Snoqualmie	King County will need decide how to keep farm land and farmers in the area in a real way. King County will need to preserve farmland with the surrounding land that impacts us. The County needs to require builders to maintain their own drainage. To build around our farms seems easier than for farmers to respond to the effects of their building on farms.
13	Snoqualmie	Development sends too much water downhill and into streams and rivers
14	Snoqualmie	We need new farmers to be educated/encouraged. Support processing. If it becomes expensive for farmers to grow the food, our prices will go up. This is a time in our economy when our customers will not support that - money is a concern.
15	Snoqualmie	Increased flooding issue. Continued development at hills surround the valley.
16	Snoqualmie	The Snoqualmie needs to be removed from the KCSDM as being a "receiving body" whereby it is exempt from "detention." The Health Dept needs to get its act together and work with farmers.
17	Snoqualmie	Fish and wildlife have too much authority. Are other government agencies afraid of them? The human factor is supposed to be figured into the equation as well but has not been. Absolutely over regulations over a minority group of people. Urban citizens making the rules do not understand the complexities of agriculture.
18	No response	Land that is being speculated for immense building into condo. Let us turn it into farmland instead it really more economic in the long run.
20	Enumclaw	Lack of land and feed costs.

ID	APD	Response (N=67, 75% response rate)
21	Snoqualmie	I am not convinced the Executive supports farming. I'd like to see King County follow suit more with what Snohomish County (focus on farming, great processes in place, future of ag mapped out) -perhaps this survey is a start to that. It's still very difficult to deal with ditches and ditch maintenance, and expensive. Permitting is still an issue. We cannot deal with any new regulations. Fencing will always be an issue in the floodplains. Any increases in buffers would dramatically impact any farming operation (I realize many are grandfathered in, but that's today, what may happen in the future?) I know the County has nothing to do with this but the poplar plantations are AWFUL to deal with in terms of the mess and debris they send down, the beavers they bring in. I do not want to see the Ag program at the county dissolved, the program is very important and the staff there are well liked, trusted, and work well with the farmers.
22	Enumclaw	The narrow strip of land between the Cascade Mountains and Puget Sound was beautiful and unique. As each decade passed, more was lost. It is strange that housing developments, strip malls and other development are not held accountable for the permanent nature of their existence. They are named after the things they destroyed- "Deer Run, "Bear Hill," and "Misty Meadow" places that are gone forever. Many of the remaining large tracts of land are owned by individuals. These individuals are not rich corporations that can affect local laws and zoning. Since agricultural lands have not been covered with fill, buildings and concrete, and since many are owned by individuals that can be more easily subdued, the public focuses its frustration there. This is where so many feel they have control. Ironically, this situation leads to impossible regulation and costs. Ultimately, the pressure destroys agriculture and/or people who just want to keep the land whole. A drive down the I-5 corridor shows us that nothing has changed. Large tracts of open space are quickly and permanently being transformed by forces the public seems to have difficulty in controlling. My concern is that people have given up on a solution and are turning a blind eye.
23	Vashon	King County makes all processes prohibitive in expense and complexity. As farmers, we have so little extra time to research proper procedures and protocol. Often we get opposing answers from separate bureaucrats.
24	NonAPD	Land use regulations still seem to make large-lot residential development the only viable economic option for many landowners. We MUST make it easier for rural landowners to make a living on their property. There are some conditional uses that exist, but the time, permitting fees and requirements often make them unrealistic options. We must expand and streamline this if we want a vibrant and sustainable rural economy.
26	Snoqualmie	1. Homes vs. land space; 2. H2O (water); 3. Small acreage areas will become very, very profitable. Planting by the inch.
29	NonAPD	That KC regulations & services support the care & raising of livestock, particularly horses. That the definition "farming" and agriculture includes horses; the boarding, breeding, raising, showing, training or sales of horses. Also horse businesses such as outfitters, camps, clinics, shows, therapeutic riding programs, etc. should be included as agriculture.
40	Snoqualmie	1) Continued development of housing/strip mall, etc.; 2) I am concerned over Department of Revenue and interpretation of ag.; 3) Flooding
41	No response	Taxes- the penalty for agland- 12% compounded annually- for 7 years, is keeping small acreage from being developed and retained as ag/open space.

ID	APD	Response (N=67, 75% response rate)
42	No response	My concern of King County, farm land is only few acres left, but KC didn't protect them, so I hope King County should really get all agency together and solve these problems.
43	Lower Green	Affording the land to do it, restrictions on value adding processing, educating kids and new farmers- everybody should be able to identify food in its growing and unprocessed state.
45	Lower Green	None
48	Vashon	Resist livestock registry.
49	Enumclaw	that it is not in king county's long term plans.
50	NonAPD	That we are losing our farm land to development and we are not encouraging people of all ages to get into the agri-business industry. I am also concerned that there are not enough educational opportunities locally for those who are interested in farming.
51	Snoqualmie	King County appears to be trying to improve the probability that farming operations will survive and prosper. Please keep the vision alive. I hope that the King County Ag Commission along with WSU extension will put together the types of educational programs that I now have travel to Snohomish County to get. Thank you for all the changes you have already made, keep up the good work.
53	Lower Green	Increasing environmental/ESA burden on agriculture can kill agriculture in this county. County government from Council-to-Exec-to-Staff is dominated by city dwellers with little or no rural or agriculture experience. Budget and staffing are overwhelmingly dominated by urban/environmental concerns to the detriment of the rural/agricultural population and economy. With continued incorporations of suburban cities, the County's focus should shift to support of their rural/agricultural population, and have the cities cover more of the cost of environmental protection for the impacts they themselves generate.
54	Enumclaw	Hyper-environmentalism run amuck! Get off of our land unless you are willing to purchase it at fair market value. My friends in the dairy industry have flooded this past year because they haven't been able to maintain their own ditch systems. The Bolt decision has done more harm to native salmon and steelhead runs than ANY surface water runoff from ANY farm on this plateau. Reverse Bolt then we can talk about surface runoff. But if you will not then please find other work and LEAVE US ALONE!
55	Enumclaw	cost of doing business here. NRCS helps a lot with free engineering, free technical help and actual money to do things but will they be able to keep helping us.
56	Enumclaw	dairy business will be forced out because the expertise is not in the area to help keep us there. most of the programs from king county and king county conservation district are focused on small farms. NRCS are the only folks left that can relate to the larger producer and help with larger jobs and costs. concerned that king co is ok about letting agriculture go that way and they are not in tune with our needs.
57	Enumclaw	Too much development
59	Enumclaw	I am concerned about losing farms to development. I am concerned about the quality of animal feed. We raise meat chickens and in the book Green, Green, Greenest I read that arsenic can be found in animal feed. This is causing me to go to organic feed at twice the cost. The high cost of feed has risen faster then the price of our hay product.
60	Upper Green	need to keep farms and open space in this county
62	Upper Green	Mansions, Howard Hanson Dam repair
64	Enumclaw	taxes and regulations
67	Enumclaw	Is there going to be a tax on cattle for gas emissions?

ID	APD	Response (N=67, 75% response rate)
69	No response	Water. I have a salmon bearing creek on the property border I have worked with King County to improve the condition of the stream bank but this is all for naught it downstream we are causing the stream to slow and flood my pastures. We continue to build housing in areas which used to flood. There are retention ponds added and said to hand the flood. It doesn't. What can I do about it?
70	No response	That more land will be lost to development, and that land lost for agriculture use.
71	Snoqualmie	Land too expensive, no support system for infrastructure (tractor parts, fertilizers, dairy supplies, etc)
72	Sammamish	Sprawl removing farm land. Land becoming so valuable that it can't be passed on as a farm.
73	Snoqualmie	Not enough protection of land. Trees are being removed/clearcutting is causing too much water run off. Not enough incentives for new farmers to start up. No mentorship program where young can glean from old timers.
74	Snoqualmie	It is so expensive to have land here. I would like to know how to get a property tax break for farming. I worry that we will lose too much farmland and won't be able feed ourselves locally.
75	NonAPD	I believe it is imperative that farmland be protected. We must consider the greater good and the future, even at the expense of individual property rights. I've watched the Green River and Sammamish valleys essentially disappear, and been heartbroken. There are many well-documented reasons for protecting a local foodshed, and we must heed them. I fear the voices of developers and property rights activists thunder too loudly.
76	Snoqualmie	We are concerned that hobby farms and equestrian operations are driving up land prices and wrecking our drainage. Horses are not agriculture. Our neighbors' horses periodically break out of their fences and only pure luck has kept them from doing thousands of dollars of damage to our crops. As it is, they at least cost us several hours of time with each incident that we stop working to try to round them up or keep them from trampling our vegetable crops. Horses are incompatible with farming. Horse operations should NOT benefit from ag property tax exemptions. Urban dwellers should not subsidize the recreational pursuits of horse owners. King County should define agriculture as "Food for People". Before we take any steps to loosen building restrictions in the Snoqualmie APD, we need to make absolutely sure that these changes will foster, not threaten, our ability to grow more food for the people of King County.
78	Lower Green	Expensive land - loss of human-food agriculture to fuel production and other Nonfood producing enterprises

ID	APD	Response (N=67, 75% response rate)
79	Enumclaw	Mainly I fear King County. I fear that the county values productive property taxes over productive property. I fear that salmon are dying because government has lost control and foresight. I fear that unnatural natural disasters that destroy farmers are a direct result of King County enabled logging, building, paving, extracting, stripping, clearing, drilling, piping, excavating, and general raping of the land. I fear that farmers are marginalized and driven into the most dangerous, least productive areas so that permits may be issued and construction can commence. I fear that King County has lost touch with agricultural producers, and that too much emphasis has been given on things like buying a "practical" Japanese hybrid city car and not enough emphasis given to getting into a dang 1970s pickup truck made out of U.S. steel and driving out and working beside, spending time, and visiting with farmers. It is impossible to represent farmers unless a person takes the time, puts in the energy, and has the desire, to get to know them. Everyone gives farmers lip service. My biggest concern is that we're all too lazy to give them some sweat services.
80	Snoqualmie	Support from King County in the way of education and resources to bring our dairy to its highest and best use based on our land conditions.
81	Enumclaw	Urban county tends to support urbanization
82	Enumclaw	I am concerned that the do-gooders who don't own horses are going to try to change our way of life out here in the country, by changing horses from livestock to "pets". Which in turn will change our tax status from agricultural to residential. That is ridiculous!
83	NonAPD	Suburban encroachment on farmland. Institutional purchases of food. policies that direct institutions to the lowest bidder school AS garden. farm to cafeteria is OK.
84	NonAPD	Main concern is the cost of land for future generations of farmers. Also the urbanization of rural areas bringing a mentality that often conflicts with the rural values and impedes the ability to continue farming. The increased promotion of farms for urban entertainment is absolutely necessary for both educational purposes and for many, their bottom line. However, it is not something that interests all farmers and I fear that the more traditional farmer may disappear in King County. The county does need to make sure though that regulations continue to be adjusted to allow for these newer retail type endeavors. Small businesses of all kinds need to be allowed to prosper in King County.
85	Snoqualmie	Disappearance of small farms producing food for people
87	NonAPD	Keep farmland for people food, not for equestrian estates which take away farmland and drive up land prices.
89	Sammamish	Need a clear definition of "agriculture" as it pertains to allowed activities that can help food producers (such as critter pads, equipment pads, building of storage or animal shelters in flood plains, etc.) A food producing definition of agriculture in this case would prevent other land users in ag zoned districts from taking advantage of these provisions.

ID	APD	Response (N=67, 75% response rate)
90	Snoqualmie	In the long term, I see threats from developers, equestrian interests, flooding, and draconian food-safety laws as the biggest threats. In the short term, I think that under-regulation of land explicitly set aside for agricultural production (i.e. the APDS) has allowed profligate misuse of farmland and has driven up the price of potential farm properties, making economically sustainable farming on one's own property nearly impossible. I believe that the County must write codes and regulations that prohibit any and all new buildings, homes, farm pads, structures, etc for anyone in the valley other than people producing food. That is to say, equestrian operations are not farms and their presence in the valley must be discouraged. Also, there is rampant flouting of existing building and zoning codes. Landowners throughout the APD build illegal farm pads, illegally raise their homes, build illegal riding arenas, build illegal barns and sheds, etc. The County does not enforce its own codes. The existence of non-farm-related structures in the APD merely serves to further drive up demand for these properties and makes them even more out of reach for those of us who would like to live and farm our own property one day in the APD.
91	Snoqualmie	It is extremely important that APD's, and specifically the Snoqualmie Valley APD, are preserved not only as farmland, but as farmland that provides food for people. It is important that the Ag Commission understand that the definition of farming or agriculture in the valley must include only farming for the specific purpose of feeding people. All other activities should be banned from the APD. The cost of land and housing is already astronomical. The only way to keep farmers in the Valley is to cease all non-farming operations or those operations where the end result is something other than food for people.
92	Vashon	cost of land
93	Vashon	Would like to see farmers markets in every neighborhood and community.
94	Vashon	I live in fear of DDES. It took 1 yr. to get permit for single-wide mobile home (after DDES initial visit was told 2 weeks) between drainage and fire department not communicating at my expense.
95	Snoqualmie	They are focused on regulation without concern for farming.
96	Snoqualmie	King County. You are recognized as being in the top most difficult 3-5 places to develop. This may not scare off Costco, Wal-Mart, etc, but why should a farmer looking to make a nice farm and decent profit go through the same aggravation as Costco? I am going through a permit nightmare with the County right now, getting a permit to pave 4,000 sq.ft. of existing gravel road. My initial estimate for plan review was over \$22,000. After a letter from my attorney, it's now about half that. Even at \$10,000, that's more to review the plans, than the cost to create the plans and pave the road. So what's it going to be like to actually try to permit and build some new farm structures? 21 acres spent over \$150,000. Given the fact that DDES is worried about their job security, the word on the street is that you are jacking your bills way up for job security. I know of a project on Vashon Island where you actually billed over \$40,000 to review plans for a 900 sq.ft. cabin. So what's it going to cost to review plans for a new barn in the flood plain? What are you going to put me through? Easier to build four homes, and take my millions, than take millions and be treated like a pariah by DDES. This is why people are not farming on farm land in King County. \$22,000 TO REVIEW PLANS FOR PAVING 4,000 SQUARE FEET OF PAVEMENT OVER AN EXISTING GRAVEL ROAD. DOES ANYONE OVER THERE EVEN REALIZE HOW ABURD THIS IS?
97	Vashon	That it truly be protected, more set aside for young farmers to have access to.

ID	APD	Response (N=67, 75% response rate)
98	NonAPD	To make it easier to farm in king county by a bigger property tax brake
99	Snoqualmie	Government employees do stupid things and really believe they are doing the right thing. The purchase of property development rights. Take a look at the map and see all the property that floods or has wetlands, yet they bought the development rights.

Appendix G: Summary of Survey Questions #1-12

Question #1: Do you farm or live in an agriculture production district (APD)?

<i>Response</i>	<i>#</i>	<i>%</i>
Yes	61	69%
No	18	20%
No Response	10	11%

Question #2: If so, which one?

<i>Response</i>	<i>#</i>	<i>%</i>
Enumclaw	19	21%
Upper Green	2	2%
Lower Green	0	0%
Sammamish	3	3%
Snoqualmie	31	35%
Vashon	6	7%

Question #3: Are you actively farming?

<i>Response</i>	<i>#</i>	<i>%</i>
Yes	83	93%
No	2	2%
No Response	4	4%

Question #4: Is farming your primary occupation (more than 50% income)?

<i>Response</i>	<i>#</i>	<i>%</i>
Yes	36	40%
No	44	49%
No Response	9	10%

Question #5: How many years have you been farming?

<i>Response</i>	<i>#</i>	<i>%</i>
2 or less	7	8%
3-4	15	17%
5-9	11	12%
10 or more	46	52%
No Response	10	11%

Question #6: Do you own or rent your farmland?

<i>Response</i>	<i>#</i>	<i>%</i>
Full Owner	56	63%
Part owner	6	7%
Renter	17	19%
No Response	10	11%

Question #7: Where is your place of residence?

<i>Response</i>	<i>#</i>	<i>%</i>
On the farm	57	64%
Off the farm	20	22%
No Response	12	13%

Question #8: What is the size of the farm (total acres)?

<i>Response</i>	<i>#</i>	<i>%</i>
Less than 5	18	20%
5-9	24	27%
10-49	21	24%
50-179	12	13%
180-499	4	4%
500 or more	0	0%
No Response	10	11%

Question #9: What services have you used? (check all that apply)

<i>Response</i>	<i>#</i>	<i>%</i>
Classes/Training	28	31%
Drainage Assistance	7	8%
Farm Plan	30	34%
Floodplain Management	6	7%
Livestock Management	9	10%
Permit Assistance	12	13%
Puget Sound Fresh	29	33%
TDR	8	9%
Other (see below)	6	7%
No Response	27	30%

Other Responses for Question #9:

get no help from any agency
Garden hotline
Farmers Home Administration loan
Farmland Preservation Program
Cost Share
Heritage Barn Program
conservation and habitat restoration
Salmon Safe Program
afraid to use county help for fear of problems

Question #10: What services have you used? (check all that apply)

<i>Response</i>	<i>#</i>	<i>%</i>
King County	26	29%
KCD	35	39%
WSU Extension	37	42%
FSA	10	11%
NRCS	13	15%
Other	9	10%
No Response	25	28%

Other Responses for Question #10:

Tilth - Farm Bureau
Seattle Tilth (2)
KC Forestry
Salmon Safe Stewardship Partners (4)
Doesn't know who did farm plan

Question #11: What agricultural practices do you use? (check all that apply)

<i>Response</i>	<i>#</i>	<i>%</i>
Certified Organic	8	9%
Organic, but not certified	44	49%

SURVEY ON AGRICULTURE IN KING COUNTY
RESEARCH REPORT

May 5, 2009

In order to increase understanding of King County residents' opinions of and experiences with farms and farming in the county, the Water and Land Resources Division, King County Department of Natural Resources and Parks, conducted a survey of county residents. Research results will be used in the report on *Future of Agriculture, Realized Meaningful Solutions (FARMS)* and in policy and program planning relating to agriculture in the county.

This report describes the survey on agriculture in King County. Research objectives are discussed first, followed by research methods, results, and key findings and conclusions. The appendix contains a copy of the questionnaire used in the survey.

Objectives

The information objectives of the survey on agriculture in King County included the following:

- Assess King County residents' opinions of the importance of having farms and farming in King County, and explore residents' impressions of farms and farming in the county;
- Assess residents' opinions of the importance being able to engage in selected activities related to local farms and farming, including purchasing farm food products and visiting farms;
- Examine the frequency with which residents purchase food produced on King County Farms, locations in which the food is purchased, and importance of selected factors in the decision to purchase food from local farms.
- Examine the frequency with which residents visit food-producing and horse farms in King County; and
- Assess residents' opinions of the importance of using and preserving land for agriculture in King County and continuing support for farmers in the county.

Research Methods

Between March 16 and March 26, 2009, a total of 450 telephone interviews were completed with residents of King County. The first 400 interviews were completed with individuals who were randomly selected from lists of county residents; 360 interviews

were completed with residents of urban areas, and 40 with residents of rural areas. Then, an additional 50 interviews were completed with individuals who were randomly selected from zip codes in rural parts of the county and who said they lived in rural areas. Thus, interviews were completed with a total of 360 residents of urban areas and 90 residents of rural areas in King County. The additional interviews with rural residents permitted more accurate assessment of the views of rural residents and comparison between urban and rural residents.

The questionnaire used in the research sought information about residents' opinions of and experiences with farms and farming in King County. It was developed with the input and approval of the King County Water and Land Resources Division. A copy of the questionnaire used in the survey is included in the appendix.

Limitations

If the 450 survey respondents comprised a random sample of all county residents, the maximum margin of error would be expected to be less than ± 4.7 percent at the 95 percent confidence interval ($p < .05$). If the 360 residents of rural areas comprised a random sample of the 1,738,195 residents of rural areas, the maximum margin of error would be expected to be less than ± 5.2 percent for urban residents at the 95 percent confidence interval. If the 90 residents of rural areas comprised a random sample of the 144,000 rural residents, the maximum margin of error would be expected to be less than ± 10.3 percent for rural residents at the 95 percent confidence interval.¹

Results

The responses to the survey on agriculture in King County are presented below for each of the information objectives addressed by the survey

Since additional interviews were completed with rural residents, there was a higher proportion of rural residents among the survey respondents than is found among the population of county residents. Therefore, the responses of urban and rural residents were weighted according to their actual representation in King County (urban – 92.3%; rural – 7.7%), so that the overall survey results presented below reflect the actual composition of urban and rural residents in the county.

In addition, the survey responses of urban and rural residents were analyzed to identify statistically significant differences between the two groups. When survey results differed significantly between urban and rural residents, those differences are discussed below.² Tables detailing responses to all questions in the survey are available separately.

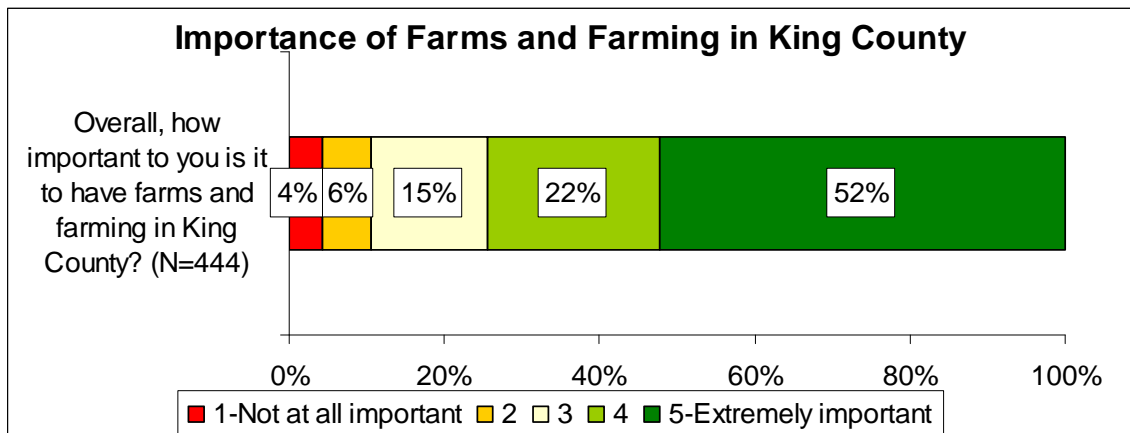

¹ Population estimates are taken from the 2008 Annual Growth Report.

² Differences between the responses of rural versus urban residents were tested using a t-test for independent samples or a chi-square test (*SPSS 15.0 for Windows*, Release 15.0.1.1, 3 July 2007). Results were considered statistically significant when the probability of that outcome occurring by chance was less than .05 ($p < .05$).

All of the survey results presented below are based on the number of residents answering each question, which usually was less than 450 since not all respondents answered every question. The number of respondents answering each question is noted in the charts and tables (e.g., N=444).

Importance and Impressions of Farms and Farming in King County

First, King County residents were asked, “Overall, how important to you is it to have farms and farming in King County?” Respondents used a five-point scale, where 1 means “not at all important” and 5 means “extremely important,” to answer this question. As the next chart shows, half (52%) of the residents stated that “to have farms and farming in King County” was “extremely important” to them, and almost three-fourths of the residents rated the importance of having farms and farming in King County a 4 or a 5 on the five-point scale where 5 means “extremely important.” Unless otherwise noted, percentages do not total 100 in this and subsequent charts due to rounding.

Ratings of the importance of farms and farming in King County provided by residents who live in rural areas did not differ significantly from the ratings provided by residents who live in urban areas.

Next, residents were asked, “When you think of farms and farming in King County, what comes to mind?” The most common responses to this question are summarized in the next table. As this chart shows, residents most frequently said that food crops or farms come to mind when thinking of farms and farming in King County, followed by milk, cheese, and dairy products or farms. Only 12 (3%) respondents said that they didn’t know King County had farms, and only 2 (<1%) said that “nothing” comes to mind when they think of farms and farming in King County. Percentages total more than 100 in the following table because some respondents gave more than one answer to this question.

**When you think of farms and farming in King County,
what comes to mind?**

(N=444)

Food crops, farms (fruit, berries, vegetables)	49%
Milk, cheese, dairy products, farms	22%
Disappearing farm lands - concrete, development	18%
A specific town or area (Carnation, etc.)	17%
Small farms, family, not big business	16%
Fresh, local, sustainable products	15%
Open spaces - fields, pastures, acreage, rural areas	15%
Farmer's markets	11%
Livestock	11%
Organic farming, healthy, good for environment	8%
Truck farms - general	8%
Animals - general	7%
Horse farms, stables	6%
Plants, flowers	5%
Gardening - backyard, community	5%
Farm lifestyle, hard work	4%
Chicken farms	3%
Farming is of little, no concern to me	3%
Agriculture - general	3%
Wheat, hay, grain farms	3%
Didn't know King County had any farms	3%

Activities Relating to Farms and Farming in King County

Residents were asked to rate how important it is to them personally to be able to do each of ten activities that relate to farms and farming in King County. As the next chart shows, the activity rated most important was, “Enjoy rural scenery and open spaces provided by the agricultural landscapes in King County.” Over half (55%) of the residents rated this “extremely important,” and three-fourths (77%) rated enjoying rural scenery and open spaces a 4 or a 5 on the five-point scale where 5 means “extremely important.”

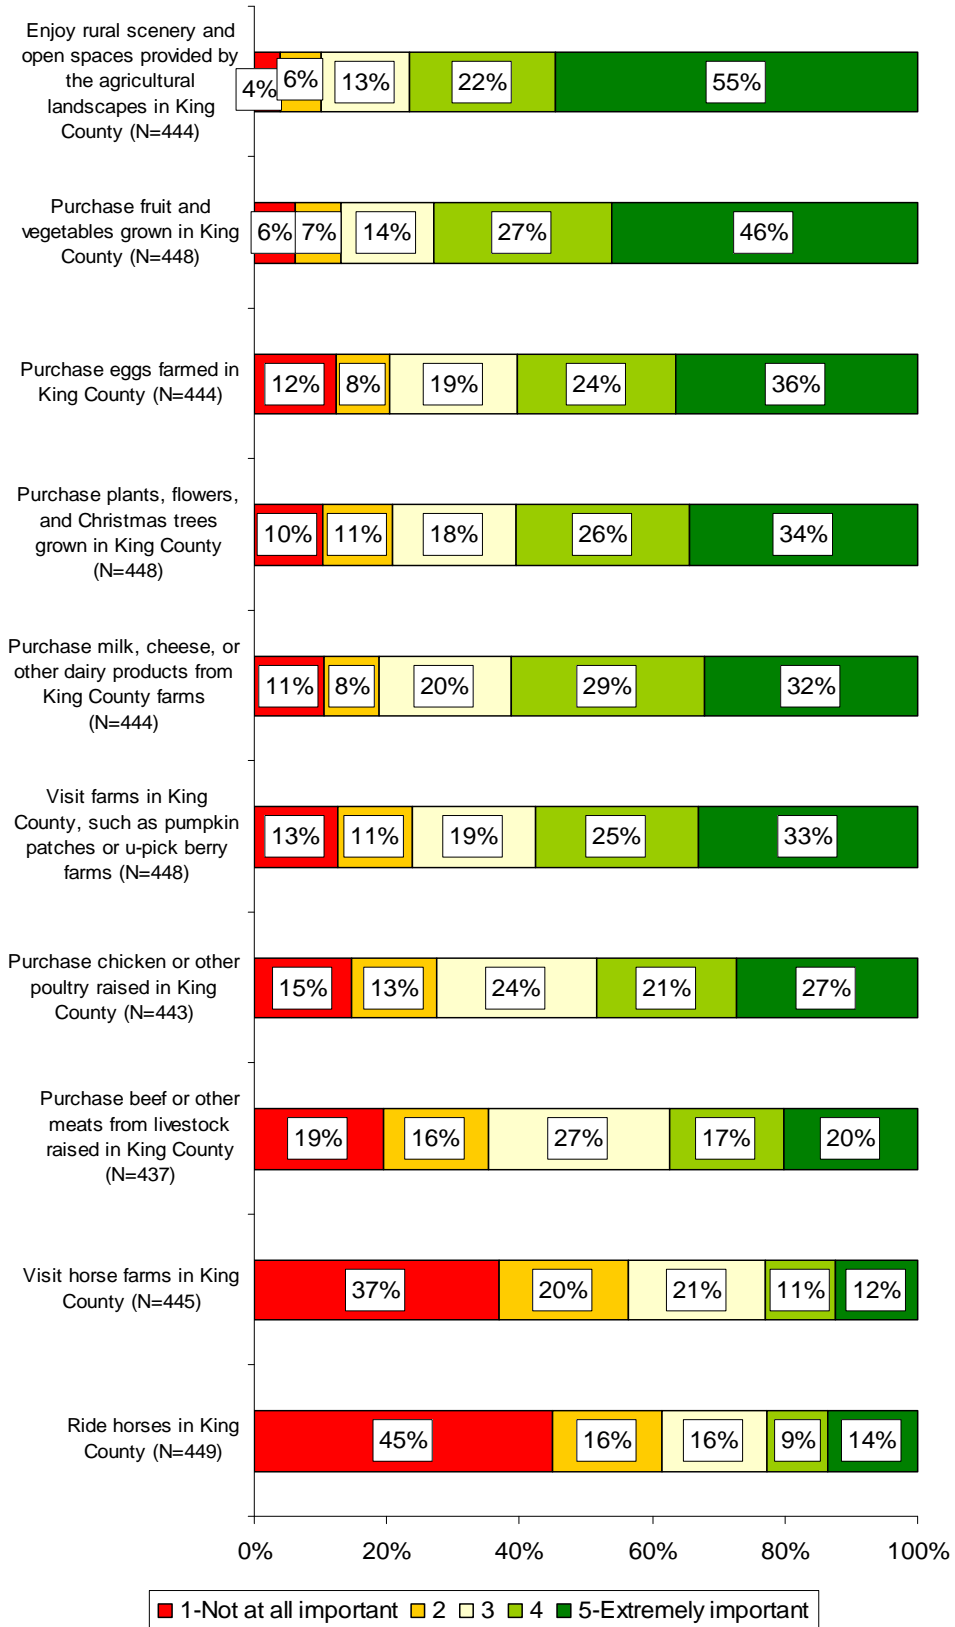

Almost three-fourths (73%) of the residents rated “purchase fruit and vegetables grown in King County” a 4 or a 5 on the five-point scale where 5 means “extremely important.”

Between 58 and 61 percent of the residents rated four activities a 4 or a 5 on the five-point scale where 5 means “extremely important”: “Purchase eggs farmed in King County,” “Purchase plants, flowers, and Christmas trees grown in King County,” “Purchase milk, cheese, or other dairy products from King County farms,” and “Visit farms in King County, such as pumpkin patches or u-pick berry farms.”

Purchasing chicken or other poultry and purchasing beef or other meats from livestock in King County were rated somewhat lower in importance (48% and 37%, respectively, rated these a 4 or 5 on the five-point scale).

Visiting horse farms and riding horses in King County were the activities rated lowest in importance by residents (23% rated these a 4 or a 5 on the five-point scale).

Importance of Being Able To Do Each Activity

Six of the ten activities relating to farms and farming in King County were rated significantly higher in importance by rural residents than by urban residents:

- “Purchase plants, flowers, and Christmas trees grown in King County,”
- “Visit farms in King County, such as pumpkin patches or u-pick berry farms,”
- “Purchase chicken or other poultry raised in King County,”
- “Purchase beef or other meats from livestock raised in King County,”
- “Visit horse farms in King County,” and
- “Ride horses in King County.”

Purchasing Food Produced on King County Farms

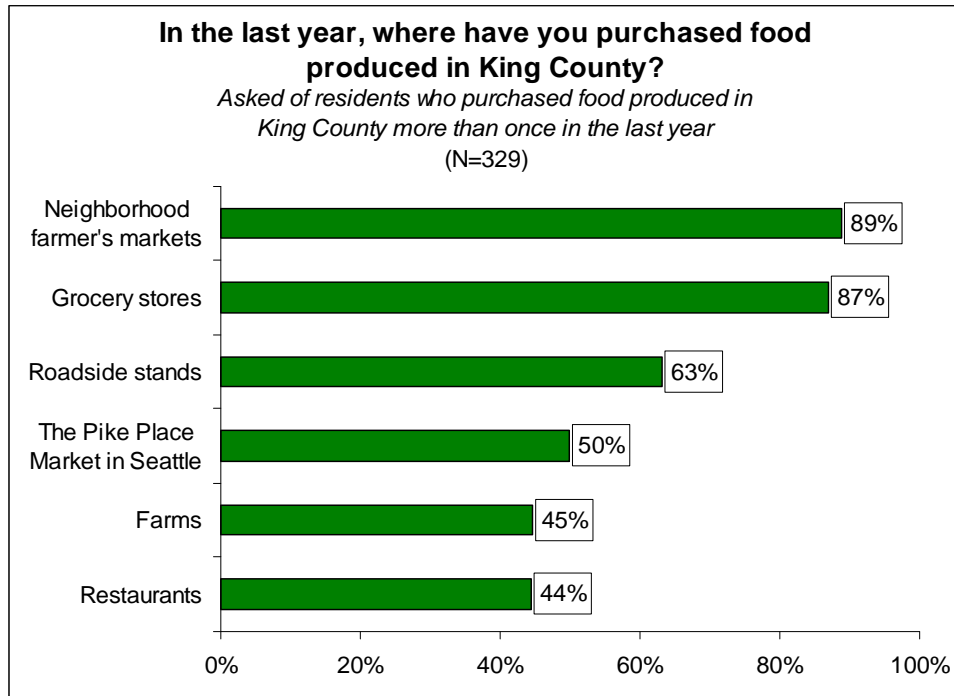

Residents were asked, “How often do you purchase food produced on farms in King County?” Eighty-five percent of the residents who answered this question said that they purchase food produced in King County more than once a year, and 62 percent purchase food produced in King County at least once a month, as shown in the next chart.

Urban and rural residents of King County did not differ significantly in how often they purchase food produced on farms in the county.

The survey respondents who purchase food produced in King County more than once a year also were asked about the places in which they have purchased the food and the importance of several considerations in their decision to purchase food from local farms.

As the next chart shows, most of the residents who have purchased food produced in King County more than once in the last year said that they have purchased it at neighborhood farmer’s markets (89%) or in grocery stores (87%). Sixty-three percent said that have purchased food produced in King County at roadside stands, 50 percent at the Pike Place Market, 45 percent on farms, and 44 percent at restaurants.

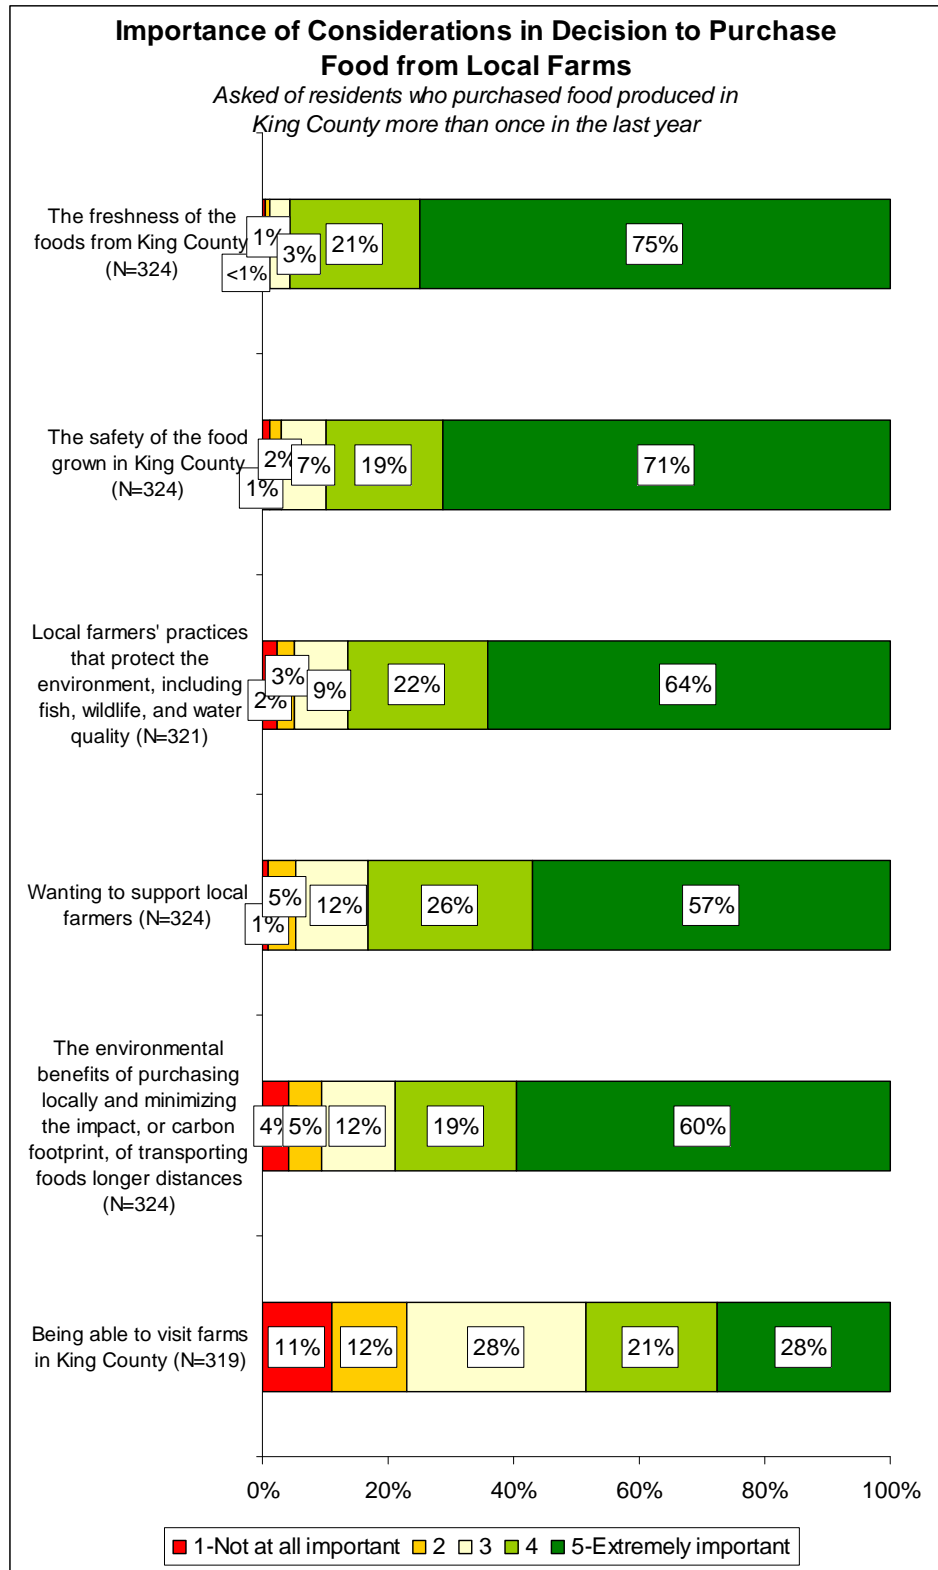

Urban residents were significantly more likely than rural residents to say that they have purchased food produced in King County at the Pike Place Market. On the other hand, rural residents were significantly more likely than urban residents to say that they have purchased food produced in King County at roadside stands. Rural and urban residents’ responses did not differ significantly for the other purchase locations.

At least 79 percent of the residents who purchase food produced in King County more than once a year rated five of the six considerations in the decision to purchase food from local farms a 4 or a 5 on the five-point scale where 5 means “extremely important”:

- “The freshness of the foods from King County,”
- “The safety of the food grown in King County,”
- “Local farmers’ practices that protect the environment, including fish, wildlife, and water quality,”
- “Wanting to support local farmers,” and
- “The environmental benefits of purchasing locally and minimizing the impact, or carbon footprint, of transporting foods longer distances.”

About half (49%) of the residents rated “being able to visit farms in King County” a 4 or a 5 on the five-point scale where 5 means “extremely important.” These results are shown in the next chart.

Four of the considerations in decisions to purchase food from local farms were rated significantly higher in importance by rural residents than by urban residents:

- “The freshness of the foods from King County,”
- “The safety of food grown in King County,”
- “Wanting to support local farmers,” and
- “Being able to visit farms in King County.”

Ratings of the other two considerations, which related to environmental considerations, in decisions to purchase food from local farms did not differ significantly between rural and urban residents.

Visiting Farms in King County

Residents were asked how often they visit food-producing farms and horse farms in King County. As the next chart shows, over 40 percent of the residents said that they visit food producing farms in King County more than once a year.

Just six percent of the residents said that they visit horse farms in King County more than once a year.

Rural residents said that they visit food producing and horse farms in King County significantly more often than urban residents.

Using and Preserving Land for Agriculture

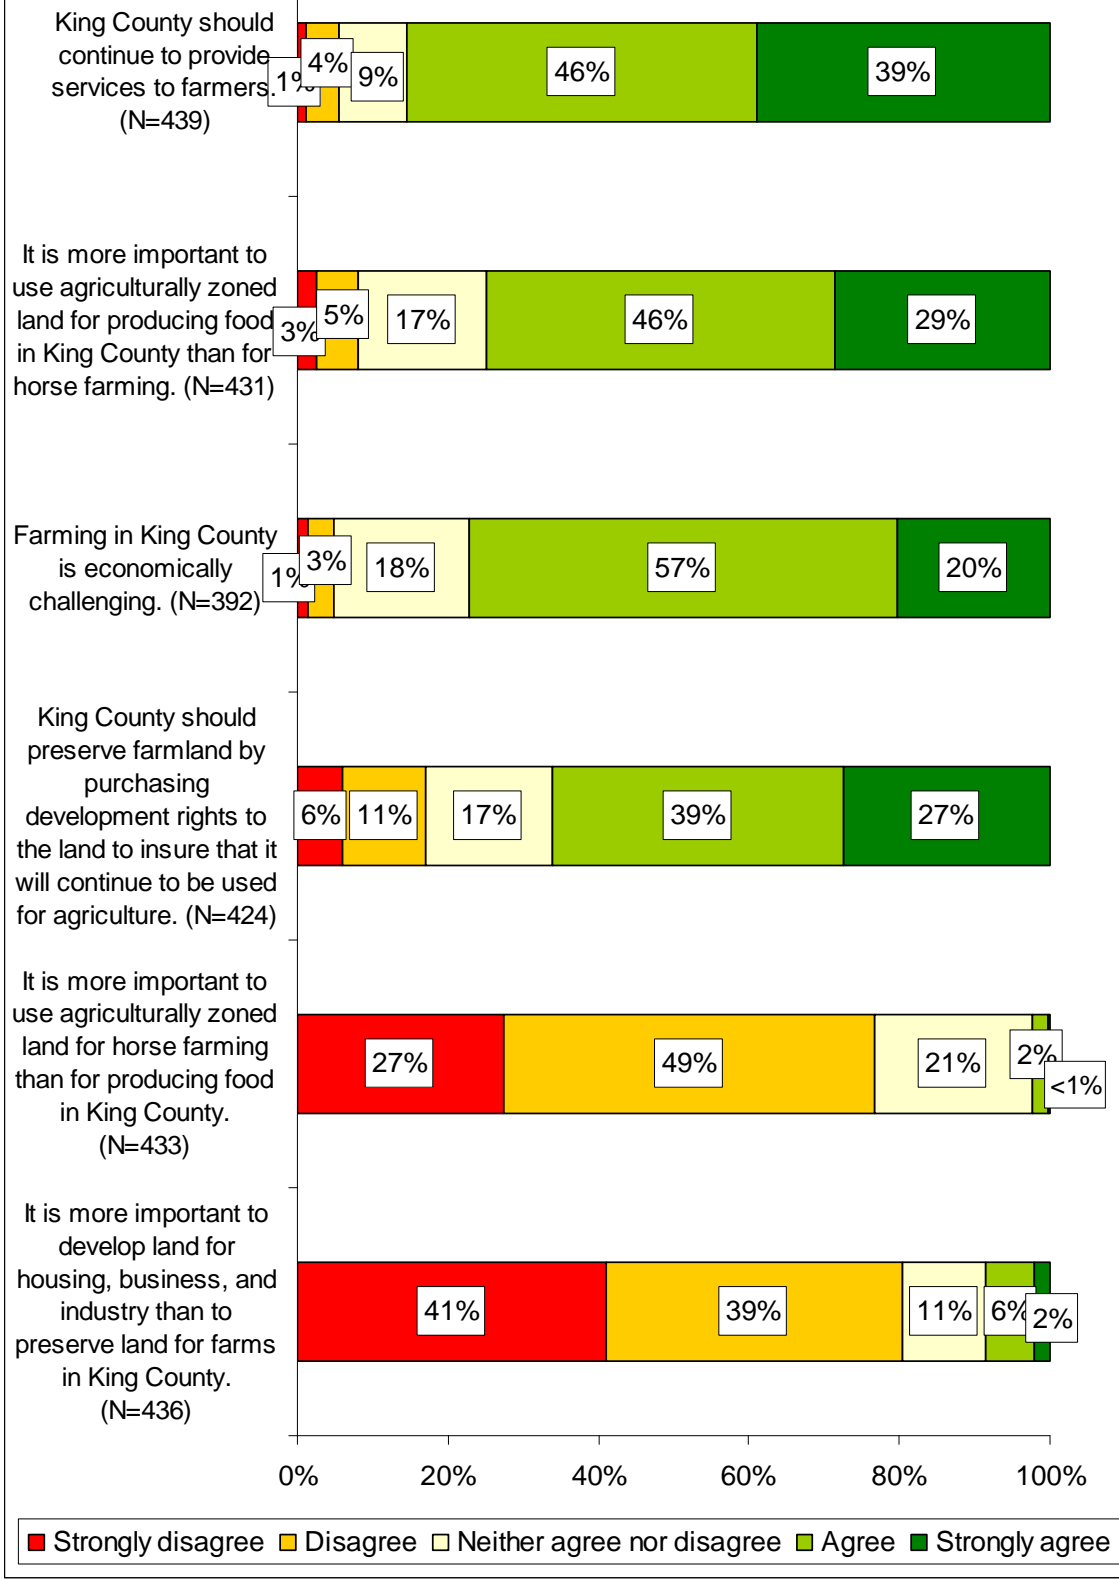

Residents were asked to indicate their level of agreement (“Strongly agree,” “agree,” “neither agree nor disagree,” “disagree”, or “strongly disagree”) with six statements about agriculture in King County, which are shown in the next chart.

Eighty-five percent of the residents said that they “agree” or “strongly agree” with the statement, “King County should continue to provide services to farmers, such as assistance with permits, drainage improvements, promotion of local farm products, and grants to improve environmental practices.”

Between 66 and 77 percent of the residents said that they “agree” or “strongly agree” with the statements, “It is more important to use agriculturally zoned land for producing food in King County than for horse farming,” “Farming in King County is economically challenging,” and “King County should preserve farmland by purchasing development rights to the land to insure that it will continue to be used for agriculture.”

Conversely, 75 and 80 percent of the residents said that the “disagree” or “strongly disagree” with the statements, “It is more important to use agriculturally zoned land for horse farming than for producing food in King County,” and “It is more important to develop land for housing, business, and industry than to preserve lands for farms in King County,” respectively.

Agreement with Statements About Agriculture in King County

Larger proportions of rural than urban residents said that they “agree” and “neither agree nor disagree” with the statement, “It is more important to use agriculturally zoned land for horse farming than for producing food in King County,” while a larger proportion of urban residents said that they “strongly disagree” with this statement. Agreement with the other statements about agriculture in King County did not differ significantly between rural and urban residents.

Forty-five percent of residents said that the amount of land used for all types of agriculture in King County should be increased, and 53 percent said that the amount of land used for all types of agriculture should be “kept about the same as it is now.” Only one percent of the residents said that they thought the amount of land used for agriculture in King County should be decreased, as shown in the next chart.

Responses to the question about whether the amount of land used for agriculture in King County should be increased, decreased, or kept about the same did not differ significantly between rural and urban residents.

Key Findings and Conclusions

The results of the survey on agriculture in King County suggest the following key findings and conclusions:

Having farms and farming in King County and being able to purchase food produced on farms in King County are important to most county residents.

- Almost three-fourths of King County residents rated having farms and farming in King County a 4 or a 5 on a five-point scale where 5 means “extremely important.”

- When asked about the importance of being able to do specific activities relating to farms and farming in King County, about three-fourths of the county residents rated being able to “enjoy rural scenery and open spaces provided by the agricultural landscapes in King County” and being able to “purchase fruit and vegetables grown in King County” a 4 or a 5 on the five-point scale where 5 means “extremely important.” Being able to “visit horse farms in King County” and “ride horses in King County” were the activities rated least important, and 23 percent of the residents rated these a 4 or a 5 on the five-point scale where 5 means extremely important.
- Asking about “farms and farming in King County” brought a variety of images to mind for county residents, but food crops and farms were mentioned most often, followed by dairy products and farms.

Purchasing food produced on farms in King County is a fairly common practice for many residents.

- Sixty-two percent of the residents said that they “purchase food produced on farms in King County” at least once a month, and 85 percent said that they “purchase food produced on farms in King County” more than once a year.
- These residents most often purchase food produced in King County at neighborhood farmer’s markets or grocery stores.
- Between 57 and 75 percent of the residents said that the freshness, safety, and environmental benefits associated with foods produced in King County, as well as wanting to support local farmers, were “extremely important” (5 on the five-point scale) considerations in the decision to purchase food from local farms.

Most residents support continuing county support for farmers in King County and using land for food-producing agriculture in King County.

- Eighty-five percent of the residents said that they “agree” or “strongly agree” with the statement, “King County should continue to provide services to farmers, such as assistance with permits, drainage improvements, promotion of local farm products, and grants to improve environmental practices.”
- Between 66 and 77 percent of the residents said that they “agree” or “strongly agree” with the statements, “It is more important to use agriculturally zoned land for producing food in King County than for horse farming,” “Farming in King County is economically challenging,” and “King County should preserve farmland by purchasing development rights to the land to insure that it will continue to be used for agriculture.”
- Forty-five percent of residents said that the amount of land used for all types of agriculture in King County should be increased, and 53 percent said that the

amount of land used for all types of agriculture should be “kept about the same as it is now.”

Rural residents rated some activities and considerations as more important and more frequently engage in some activities that relate to farms and farming in King County than do urban residents.

- Rural residents engage in some activities relating to farms and farming more often and rate these activities as more important than do urban residents, including visiting food-producing and horse farms; the importance of being able to purchase plants, poultry, and meats from King County; and the importance of visiting farms and riding horses in King County.
- The freshness and safety of foods grown in King County, wanting to support local farmers, and being able to visit farms in King County were more important considerations in decisions to purchase foods produced in King County for rural than for urban residents.

Hello, this is _____ with Consumer Opinion Services, a research firm in Seattle. I am calling on behalf of King County as part of a research study. For this study I need to speak with the [male/female] head of this household. Would that be you?

- CONTINUE -- Yes 1
ASK TO SPEAK TO PERSON/FOR TIME TO CALL BACK -- No 2
ASK TO SPEAK TO PERSON/FOR TIME TO CALL BACK -- DK/REF 3

[REPEAT FIRST PARAGRAPH IF NECESSARY.] I am calling on behalf of King County strictly for research purposes. Your answers will be completely anonymous and confidential and will be used by King County in developing policies and programs relating to agriculture in the county. This is not a sales call, and no sales calls or solicitations will result from this call. King County is very interested developing the best possible programs and policies that relate to agriculture.

Note: If respondents ask, they can direct any questions about the survey to Steve Evans, King County Water and Land Resources Division, 206-296-7824.

1. First, do you live in King County?

- CONTINUE - Yes 1
THANK & TERMINATE - No 2
THANK & TERMINATE - DK/REF 3

2. Would you say that you live in an area that is mostly urban, suburban, or rural?

- CONTINUE - Urban 1
CONTINUE - Suburban 2
CONTINUE - Rural 3
THANK & TERMINATE - DK/REF 4

3. Overall, how important to you is it to have farms and farming in King County?
Please rate the importance of farms and farming on a five-point scale, where 1 means “not at all important” and 5 means “extremely important.” Would you rate having farms and farming in King County a 1, meaning “not at all important,” a 5, meaning “extremely important,” or some number in between?

DK/REF 6

4. When you think of farms and farming in King County, what comes to mind? What else? PROBE FULLY.

5. Next I'm going to read a list of activities. Please tell me how important it is to you personally to be able to do each of the activities. Please use a five-point scale where 5 means "extremely important" and 1 means "not at all important." First, how important is it to _____: READ AND ROTATE.

	Not at all important					Extremely important	DK/REF
Purchase fruit and vegetables grown in King County	1	2	3	4	5	6

- Increase 1
- Decrease 2
- Keep about the same 3
- DK/REF 4

13. This last question is for classification purposes only. What is your home zip code?

_____ DK/REF 99999

14. Thank you very much for your time and opinions. Your input will be very helpful to King County as it works to develop the best possible policies and programs for agriculture.

15. Record gender (DO NOT ASK):

- Male 1
- Female 2

Appendix D.

Community Partners Survey and
Summarized Results

2009 FARMS Report Appendix D

Community Partners Survey and Summarized Results

As part of the research for the *FARMS Report*, the King County Agriculture Program surveyed about 70 organizations that partner with the King County Agriculture Program. These groups vary significantly and include governmental organizations that the county works with on land use, code and policy; non-profits that the county works with in areas such as marketing, economic development, and educational programming; groups that receive financial assistance; and representatives of farmer groups that are impacted by county regulations and policy.

Thirty responses were returned. Following is a short summary of the results.

Question 1: Please identify the challenges, concerns and services that are the most important for organizations and local governments to be prioritizing in work plans over the next 5 – 10 years in order to help ensure the future of farming in King County and western Washington.

30 responses

- Access to land: cost, protecting land inside and outside the Agricultural Production Districts, farmland preservation programs (77 percent)
- Access to appropriate infrastructure: process, distribution and transportation needs (67 percent)
- Development pressures: incompatible land uses, McMansions, cumulative impacts of growth (43 percent)
- Market Development: new markets and products that provide a fair price—farmers markets, institutional sales to schools, health care, hotels (40 percent)
- Farmer transitions: succession planning for retiring farmers, support for new farmers such as finding land, training, technical and financial support (37 percent)
- Flooding impacts, regulatory issues, and access to capital (all at 33 percent)

There was less consensus about identifying the five least important challenges, concerns and services important to farming viability. Many respondents did not answer this section, stating that all issues were important. Some respondents stated the issues they identified as least important were still important, but less so than those identified as priorities.

- Farm labor issues: finding workers, cost of labor, housing, immigration (37 percent)
- Access to capital (37 percent)
- Food safety issues: understanding and complying with new standards, additional training (37 percent)
- Research to gather essential data to support agricultural activities: land use research, economic impacts of farming, farmers market research (37 percent)
- Cost of doing business: cost of permits, high taxes on agricultural buildings, equipment, insurance (33 percent)
- Marketing and consumer education: marketing about locally grown food, helping to increase demand (33 percent)

Question 2a: Please identify the top five challenges, concerns and services your organization is prioritizing to work on for the next 5-10 years in the first column. (30 responses)

- Marketing and Consumer Education (17 responses)
- Education and Training (16 responses)
- Market Development (15 responses)
- Access to appropriate infrastructure (14 responses)
- Research to gather essential data (11 responses)
- Advocacy (10 responses)

Of the top six priorities surveyed organizations are working on, only two (market development and access to appropriate infrastructure) were identified in the top five priorities to help ensure the future of farming over the next 5-10 years (Question 1).

Question 2b: Please identify which of the challenges, concerns and services you think the King County Ag Program should prioritize in its programming over the next 5-10 years.

- Access to land (22 responses)
- Access to appropriate infrastructure (17 responses)
- Development Pressures (16 responses)
- Regulatory issues (15 responses)
- Flooding Impacts and Cost of doing business (12 responses for each)

Question 3a: We know there are many organizations working on a wide variety of issues facing agriculture. Do you see any gaps in services to farmers in western Washington, specifically King County, that organizations and governments are not responding to, or are responding inadequately? If so, what are they? (20 responses)

Comments about gaps in services fell into several themes:

- Helping farmers sell more products: develop infrastructure, help make farm-institution sales easier, coordinate processing and distribution, develop new products and take to market, King County advocate for strong direct sales sites in cities, policy work to improve farm to institution sales (12 responses)
- Land use issues: wetland mitigation banking is removing farmland, use land for food and fiber not other purposes in APD, policy work on development pressures, farmland preservation (5 responses)
- Flooding: more policy work about impacts, create stable task force for flooding issues, training/research about food safety, more after flood relief support (5 responses)
- Farm labor (2 responses)
- Access to land (2 responses)

Question 4: Are there areas where there is excessive overlap of services to farmers in western Washington, specifically King County? If so, what are they? (17 responses)

Comments about overlap in services fell into several themes:

- No overlaps, farmers need all the help they can get (6 responses)
- Marketing: could back off on consumer marketing in King County because demand for local food exceeds supply; refine message to target institutional purchasing; bundle marketing dollars to cover local, regional, and state efforts to buy local; do not duplicate research (6 responses)
- Government overlap: King County duplicates others' services, too much red tape on some programs, contract out more services (4 responses)
- Partner communications: too many meetings, need more coordination, not clear about who is doing what (3 responses)

Question 5: You and your organization were chosen to participate in this survey because the King County Ag Program partners with you in some way. We would like feedback on how this partnership is working for you and what we could do better. (17 responses)

5a: In what work areas do you partner with the King County Ag Program?

There was a wide range of answers reflecting each organization's unique relationship to the Agriculture Program.

5b: What is the role of King County Ag Program in the partnership?

Most organizations partnerships with the Agriculture Program vary depending on the activity.

- Support role (14 responses)
- Lead role
- Financial
- Partner, colleague
- Advocate

5c: How can King County make the partnership more effective? (21 responses)

- More communications, better coordination, be more proactive asking for partner help, give partners more information (7 responses)
- Fine as is (5 responses)
- More financial resources would be great (5 responses)

6a: We would like you to comment on the current scope of work of the King County Ag Program. What types of programs or work activities do you think the King County Ag Program is most effective at performing? (26 responses)

This was a free form question with several themes that became apparent.

- Farmland Preservation
- Dealing with government regulations, land use and permitting issues
- Interfacing between government and farmers, helping decipher code
- Working on Puget Sound Fresh, farmers market support and marketing

6b: When thinking about the work of the King County Ag Program, can you identify any areas that could be better done by another organization? (17 responses)

- Six respondents stated responded there were not other work areas to improve
- Three respondents mentioned education and research could be better done by other groups
- The rest of the answers covered a wide area. Several mentioned marketing related activities that could be done better by others.

Appendix E.

Agriculture Production District Land Use
Category Descriptions

2009 FARMS Report

Appendix E

Agriculture Land Use Survey

Category Descriptions

Livestock/Forage:	Livestock present on the field, visible animal waste, presence of hay bales, visible tire tracks from cutting, baling or chopping, manure spreading
Managed Grassland:	Grassland or field where there are no signs of livestock/forage but is being cut at agronomic stubble heights (<3 inches)
Corn (2006 only):	Stand alone corn field use for grain or silage (vegetable corn included in Market Crops/Produce). Recorded as Livestock/Forage in 2009 survey.
Market crops/Produce:	Flower and vegetable gardens (must be larger than only self-sustaining)
Unmanaged Grassland:	Grassland or field where there are no signs of livestock/forage that is not being cut for length
Nursery:	Presence of a nursery
Tree Farm:	Presence of a tree farm (i.e. poplar plantation)
Orchard:	Presence of at least 6 orchard trees
Unmanaged Orchard:	Presence of orchard trees that show no signs of being harvested, pruned, fruit falling to the ground; collection must be visible on aerial photos
Grapes:	Presence of grapes
Sod farm:	Presence of sod farm
Forested/Upland:	Presence of forest, typically continuous multi-parcel tracts of trees; small, isolated groves not included
Sports/Recreation:	Presence of ball fields (baseball, soccer, etc.), parks, golf courses, grassland preserves that can be used for recreational hiking, sports complexes, campgrounds
Too Wet to Farm:	Presence of standing water visible from road or in aerial photos

Marsh or Wetland:	Presence of marsh, wetland, reeds, etc.
Other	Roads, rivers and lakes, buildings, any lawn or grass cut too short to be used for grazing, houses, mining or construction, non-tillable surfaces, non-agriculture parcels that are not covered by other categories
Horse (2009 only):	Horses present. Recorded as Livestock/Forage in the 2006 survey.

Notes on categories

- Depending upon the use of rotation and presence of activity, some parcels categorized as Managed or Unmanaged Grassland could be categorized as Livestock/Forage. Attempts were made to determine if any grassland fields were previously used or looked as if they were being kept up for future use (i.e. well-managed fencing, electrical tape).
- When a parcel had multiple land types it was divided into multiple records to indicate these uses. This was not done for buildings on an agriculturally-used parcel (such as a house on a livestock property) or when the other land type was insignificant (such as some trees on a property). In these instances the entire parcel was categorized as the majority use in order to keep record count at a manageable level.

Appendix F.

How much land is needed to feed King County's population?

How much land is needed to feed King County's population?

The chart below shows how much land it might take to grow about 27 of the most common fruits and vegetables consumed by an average American as reported by U.S. Department of Agriculture (USDA) Economic Research Service consumption data. Production estimates are based on published yield data from Washington State and Oregon State Universities or local growers when available. The amount of calories a person needs is based on a 2,000 calorie a day diet.

2,000 calories / person x 2 million people =4 billion(4,000,000,000)calories/day x 365 days = 1.46 trillion (1,460,000,000,000) calories/year								
	Per capita consumption lbs /year	x 2 million people= tons	yield/ acre/ton	acres needed to supply	Total lbs (1,000)	Calories/lb	Total calories (1,000)	% of Per Capita consumption
Snap beans	1.8	1,800	6.5	277	3,601	80	288,080	100%
Broccoli	5.4	5,400	5.5	982	10,802	139	1,501,478	100%

Strawberries	8	8,000	5	1,600	16,000	92	1,472,000	100%
Apples fresh & Juice)	40	40,000	60	670	20,100	106	2,130,600	
				2,419			3,781,252	
TOTAL				14,445			61,844,232	

The chart below indicates how much land might be needed to raise livestock for consumption. There are two lines for each animal. The first line shows how much land it would take to produce 100% of what might be consumed. The second line shows how much could be produced on 6,000 acres. For example, for beef the top line shows that 372,000 acres would be needed to raise all the beef that county residents consume. The second line shows that King County farmers can only produce less than 1% of the beef animals we consume on 6,000 acres

	Per capita lbs /year	x 2 million people= tons	# of animals needed	Acerage needed	Total Lbs (1,000)	Calories/lb	Total Calories (1,000)	% of Per Capita consumption
Beef	62	62,000	124,000	372,000	124,000	600	74,400,000	
	62	500	2,000	6,000	1,000	600	600,000	0.08%
Pork	46	46,000	707,692	707,692	92,000	700	64,400,000	
	46	138	6,000	6,000	276	700	193,200	0.03%

Climate Change Impacts

Climate Change Impacts on Agriculture

Agriculture in King County is sensitive to climate variability. Too little precipitation may result in not enough water for irrigation; while too much causes drainage problems and fields that are too wet to plant in the spring or harvest in the fall. Plants and livestock can be stressed by variable or extreme temperatures. The lack of extended cold periods allows certain pathogens and pests to persist and damage crops and harm livestock. Most of the county's agricultural land is located in low-lying river valleys so crops, equipment, structures and animals are very susceptible to flood damage. Climate change predictions are that most of these problematic conditions will become worse in the future and may affect:

- precipitation necessary for plant growth and irrigation
- pest and disease problems to crops and livestock
- types or varieties of plants grown
- time of harvest
- crop yields and livestock production
- energy and fuel costs and availability
- availability of livestock feed as crops elsewhere are affected (for example, hay from eastern Washington).

The water supply issue is very significant to agriculture, but it affects many other areas as well. As summer supplies decrease, there will be increased competition for water to serve farmers, fish, municipal water providers, and hydroelectric facilities. It is important that agriculture is considered in regional water supply planning and distribution. Creative solutions might include reclaimed water, water provided via pipe or groundwater recharge, and winter storage.

The potential impacts of climate change and the need to adapt are unlikely to be foremost on the minds of many farmers. Other issues, such as remaining economically viable for another season, are more immediate to the agricultural community. Instead, the relevance of climate change may be the ability to participate in clean energy campaigns. Farmers may see an opportunity to develop biofuels or other climate-friendly energy sources such as anaerobic digesters or wind power. Farmers may also benefit from new crops that can be grown in the slightly modified climates of the future.

The agricultural sector could benefit from more information on projected precipitation and temperature changes and research on new crop types and varieties better suited for the region as the climate changes. Adaptation strategies for the near-term include:

- acceleration of agricultural water supply planning, including an assessment of current needs and shortages
- improvement of economic conditions for agricultural enterprises (increased markets, reduced regulations)

- facilitation of reclaimed water provision to farmers.

Longer-term solutions might include facilitating land grant university research from institutions, such as Washington State University (WSU), for long-term agricultural adaptation to climate change.

In addition to the King County Agriculture Program, support to agriculture in adapting to climate change will have to come from other agencies and groups: King County Department of Development and Environmental Services, Washington State Department of Agriculture, Washington Department of Fish and Wildlife, Washington State Department of Ecology, and WSU Extension & Research Programs, the King Conservation District, and U.S. Department of Agriculture's Natural Resources Conservation Service (NRCS).

SNOQUALMIE FLOOD-FARM TASK FORCE REPORT

January 14, 2008

I. INTRODUCTION

A. Purpose and Scope

This report contains the findings and recommendations requested by two separate but related pieces of legislation adopted by the King County Council:

1. Task Force – Motion 12559. The King County Executive was directed to convene a Task Force that included agricultural representatives to review measures intended to encourage the continued viability of agriculture in the Snoqualmie Valley Agricultural Production District. The Task Force included representatives from the agricultural community, Hmong, and the King Conservation District.
2. Demonstration Project – Ordinance 15883. This ordinance authorized a demonstration project for the repair or reconfiguration of existing livestock flood sanctuaries (or “farm pads”, the term to be used in the report). The Task Force established under Motion 12559 was instructed to evaluate the effectiveness and success of the demonstration project.

The findings and recommendations will help achieve the multiple objectives of improving the viability of agriculture in the Snoqualmie River Valley while simultaneously maintaining floodplain management that results in no adverse impacts and furthering salmon recovery in the lower Snoqualmie River.

B. Agriculture and Floods: Background

The Snoqualmie Valley is a rich agricultural area with over 14,000 acres in a variety of productive farms. King County has invested in preserving the agricultural land and in helping to maintain agriculture viability. The Snoqualmie Valley Agriculture Production District (APD) was designated in the 1985 King County Comprehensive Plan, and subsequently designated as agriculture land of long term commercial significance under the Growth Management Act. The County’s Farmland Preservation Program has further protected 4700 acres through the purchase of development rights. The County recognizes that the preservation of the land is not enough to retain successful farming, and has provided marketing and other technical assistance to help farmers to overcome obstacles and to take advantage of opportunities in an urbanizing county.

The nature of farming in the valley has changed over the years. Early settlers developed successful dairies and other livestock operations. Some of these are still operating today. As

the county became more urban, land became more expensive, and markets changed, farms became smaller. Farmers began growing higher value vegetable, berry and niche crops. Many of these smaller, specialty farms are located on the fertile valley floor, and include no high ground, making these operations more vulnerable to flood damage.

During the Thanksgiving 1990 flood, farmers in the Snoqualmie Valley lost over 500 cows, calves, and heifers, and hundreds of tons of alfalfa, hay, dry grain, and straw. The agricultural losses from the Presidential-declared flood disaster in November 2006 renewed attention to the needs of Snoqualmie Valley farmers to be able to protect their investments from flooding if farming is going to remain viable in the Snoqualmie Valley (APD). The 2006 losses included fences, crops and bulbs in fields, chickens and other animals, hay and equipment. Over one million dollars in losses were sustained by the Hmong farmers alone. A sense of urgency stems from the concerns that climate change will increase the frequency, timing, duration and magnitude of floods.

Farmers appreciate that flooding is a part of the reason they exist. Floods replenish the rich agricultural soils and they preclude more intense development in the valley, allowing agriculture to survive. In fact, almost all of the productive agriculture in King County is located in floodplains. However, between 1990 and 2006, farmers in the APD have experienced four floods larger than any flood in 75 years of records measured at Carnation, and considerably longer than that according to anecdotal information from older farmers. Seeds and seedlings, bulbs, tubers, winter annuals, and perennial crops cannot survive prolonged inundation by flood waters. While landowners can manage livestock or poultry in emergency conditions for a few days, they cannot sustain such flood emergency operations for a week or two. Similarly, farmers can recover from occasional serious floods, but cannot sustain losses year after year.

Before 1990, farmers accommodated flooding in the valley in three ways:

- constructed elevated buildings in which to operate agricultural activities;
- hauled in fill to elevate areas for buildings or “farm pads”; or
- moved livestock or equipment to nearby higher ground either when a flood was imminent, or at the beginning of winter for its duration.

Many of the dairies were built immediately adjacent to the river because this was naturally the highest ground and because milk was transported by boats on the river. Houses and barns were elevated on pilings or on fill, or on naturally high ground at the edge of the floodplain. In the event that one did not have high ground on their own property, it might be available on neighbor’s land where livestock and equipment could be moved before a flood. After the unprecedented loss of cattle in the flood of 1990, “critter pads” were allowed on a one time basis by the County and the Federal Emergency Management Agency (FEMA) as “sanctuaries” for livestock during floods.

Today, many of the smaller farms do not include high ground, and regulations to ensure property protection for all landowners have precluded the option of building elevated pads with fill within the designated Federal Emergency Management Agency (FEMA) floodway, which is mapped to include a significant portion of the Snoqualmie Valley Agricultural

Production District. Over sixteen hundred acres that could be farmed are out of production or under-utilized. While we do not know why these acres are not being farmed, some valley residents have indicated a contributing factor may be the lack of high ground to support farming operations. Many of these farms operate well into the winter, so they are unable to move equipment out of the valley for the duration of the flood season. Farmers dismissed the option of an off-site shared storage facility because of inaccessibility to their equipment, which they work on during the winter months, security concerns for equipment and animals left unattended, and the possibility of the spread of disease among animals. Additionally, some landowners are reporting they have fewer hours to prepare for a flood because waters are rising more rapidly. In some areas of the Snoqualmie Valley APD, road closures occur in each flood, making it impossible to move goods and livestock out of the floodplain.

The vegetable and flower crops have an additional vulnerability to floods, in that they may still be in the ground when the fall floods hit, or they may need to be planted in the spring before the spring floods recede. A new threat to agricultural viability appeared after the November 2006 flood. As a result of food contamination caused by toxic chemicals and e-coli in the floodwaters from Hurricane Katrina, the federal Food and Safety Administration (FSA) declared that food crops contaminated by flood waters could not be sold for human consumption. Many Snoqualmie Valley farmers, who had invested in winter greens and other vegetable crops, had to throw away tons of food. This heightened agricultural concerns about the frequency, severity, and source of flood waters.

Farmers who lease land face the challenge of persuading the landowners to invest in the infrastructure - new elevated buildings or elevated farm pads – for flood readiness and farm operations. Approximately thirty Hmong families farm in the Snoqualmie; only three of these families own land. While there are a lot of people who would like to lease land to farm, they generally do not have sufficient capital. Landowners have relatively little incentive to invest out of pocket to help their lessees avoid potential flood losses. If there is no elevated area, lessees are limited to short summer season farming options.

C. Flood Management - Federal, State, and Local Regulations

The goal of the County’s floodplain management is based on the principle of “No Adverse Impact”. Regulations and policies are designed to ensure that the actions of one property owner do not adversely impact the rights of other property owners, as measured by increased flood peaks, flood stage, flood velocity, and erosion and sedimentation. The safest, most effective and least-cost floodplain management strategies to minimize risks to public safety and preventing costly damages is to significantly limit occupation of the floodplain by people or infrastructure and to ensure that cumulative actions by public and private entities do not worsen flood conditions. The recent devastating floods in Lewis and Thurston counties was in part the consequence of allowing unregulated and unmitigated development in floodplains which demonstrated that cumulative actions result in significant public safety risks and damages to public and private property.

In the late 1960s, in response to the devastating effects of unmitigated development in floodplains, the expense and unreliability of structural flood-protection projects, and the huge

cost of federal disaster assistance, the U.S. Congress established the National Flood Insurance Program (NFIP), which is currently administered by FEMA now within the Department of Homeland Security. In order for landowners to purchase federally backed flood insurance, the community must adopt the minimum standards of the NFIP. Among the federal regulations, the most relevant to agriculture is prohibition of any development within the FEMA floodway that will result in an increase in the base flood elevation, often referred to as the 100-year flood. This is commonly known as the “zero-rise” standard.

Nearly all jurisdictions throughout the United States, including state agencies, recognize that the NFIP minimum standards are not adequate to ensure No Adverse Impact from floodplain development. Washington State legislators have prohibited the state from adopting standards that are more restrictive than the minimum NFIP standards with one exception - that of prohibiting new residential development within the FEMA floodway.

Since 1990, King County code has included some regulatory standards that exceed mandatory federal and state requirements. These are applied uniformly to all land uses, including agriculture. The challenge for King County is that nearly all of the Snoqualmie Valley APD lies within the FEMA floodway, which is where the most protective federal, state and local standards apply because it generally includes the area of highest flood risk. The following are the standards that the Task Force identified as affecting agriculture opportunities in the Snoqualmie Valley APD:

- New residential and non-residential buildings have not been allowed, with the exception of a provision to allow the repair, reconstruction, replacement or improvement to an existing farmhouse.
- “Substantial improvements” to existing buildings have not been allowed.
- Construction of “livestock sanctuaries” or “farm pads” have been allowed under King County code up until 2005, but with the exceptions of those recently constructed under the emergency Demonstration Project, Ordinance 15883, and in the early 1990s under similar emergency circumstances; no new facilities have been constructed. The standards for siting and construction were so restrictive that the feasibility of constructing a new pad was limited and generally cost prohibitive for some. Both exceptions were achieved through agreements with FEMA and the Washington State Department of Ecology.
- Structures have not been allowed to be constructed on “livestock sanctuaries.”
- Compensatory storage is required at the same elevation for any development in the floodplain, including the construction of “livestock sanctuaries” or “farm pads.”

Recognizing that agriculture is a low-density use that occupies significant floodplain acreage in King County, the Task Force recommends specific modifications to King County code to provide flexibility for agricultural land uses while at the same time maintaining a strong “No Adverse Impact” floodplain management program.

II. DEMONSTRATION PROJECT (Ordinance 15883)

A. Purpose

K.C.C. chapter 21A.55 allows “demonstration projects” as mechanisms to test and evaluate alternative development standards and processes prior to amending King County policies and regulations. Specifically, Ordinance 15883 authorized a demonstration project for the repair or reconfiguration of existing livestock flood sanctuaries. The Task Force was instructed to evaluate the effectiveness and success of the demonstration project.

B. Summary of the Demonstration Project Results

The demonstration project was an enormous success.

The Agriculture Commission approved thirteen proposed farm pads as eligible for participation in the project. These were modeled for compliance with flood management standards. Eleven of the eligible participants followed through with the application for an exemption, and received their eleven shoreline exemption letters. One participant dropped out after his exemption was issued.

Of the ten who have proceeded with their projects:

- Seven landowners constructed farm pads; they were prepared for flood season and have reported a reduction in stress that they felt with flood season approaching.
- Five of these are now able to significantly expand their agricultural operations and to make investments in additional livestock, equipment or supplies because they have a safe place for those investments to withstand flood conditions. The other five may maintain a similar level of operation but no longer risk losses.
- Six of the farm pads are located in a cluster in the southern half of the Snoqualmie Valley APD which brings a renewed vitality to agriculture in this area.
- Four pads increase the viability of parcels enlisted in the Farmland Preservation Program, one of which is the second largest dairy in the Snoqualmie and another part of the new Puget Consumer Co-op Land Trust.
- Three landowners were unable to construct their pads because of weather conditions, wet fields, and lack of available fill.

As directed by ordinance, the Department of Natural Resources and Parks (DNRP) completed hydraulic modeling for compliance with both King County and federal flood hazard regulations. The modeling was conducted both individually and cumulatively for the thirteen proposed projects, and did not account for compensatory storage that is being provided for some of the pads. The results were as follows:

- Individually, none of the 13 individual farm pad alterations that were proposed and modeled in the preliminary analysis would result in a measurable rise in flood elevation, as defined in King County code.
- Cumulatively, the 13 farm pad alterations that were proposed and modeled would not result in a measurable rise in flood elevation, as defined in King County code.

- Model results did show some sensitivity to the modeled alterations, including minor rises in both calculated water surface elevations and energy grade near most of the pad sites. At two of the sites these rises were almost measurable, as defined by the code, but none exceeded that threshold.
- The provision of compensatory storage was a challenge in this demonstration project: only three of the projects were able to provide compensatory storage at the same elevation. Six others provided compensatory storage, in some cases not quite all required; and one provided none at all.

The environmental review of the projects was conducted by the ecologists of DNRP's Water and Land Division (WLRD). Current wetland and stream regulations did not affect the placement of the pads.

Many landowners in the Snoqualmie Valley APD have commented that this project sends a new and crucial message that they will once again be able to expand their operations with the confidence they can protect themselves. More landowners would have participated if the opportunity had occurred with a different timeline and earlier in the year.

The project demonstrated that a staff team could respond in a very compressed time frame with a high degree of coordination among the Department of Development and Environmental Services (DDES), DNRP, the King County Agricultural Commission, and the King Conservation District (KCD), driven by a mutual understanding of the urgent need to beat the rain and flood season. The team from the River and Floodplain Management Unit, Science Unit, Critical Areas Review, Clearing and Grading, GIS mapping unit, Agriculture Program, KCD farm planners and Natural Resource Conservation Service (NRCS) engineers/planners had to each reorganize work priorities and work schedules to meet deadlines and respond to the unique needs of the applicants. This was an immense effort and other work priorities shifted. While this course would not be recommended as a standard mode of business, the results of providing both immediate and long-term protection to these landowners is satisfying for all involved.

C. Evaluation of Alternative Development Standards

Ordinance 15883 allowed modification to several areas of King County Code and to the standards in the Farm Management Plan Public Rule in order for the pilot project to occur. These changes are listed below and evaluated for effectiveness.

1. Modified K.C.C. 16.82.095 to allow clearing and grading between October 1 and April 30.

Evaluation: The timeframes set forth in Ordinance 15883 could not be met without this modification. However, wet weather complicated these earthwork projects, and it limited the ability of some participants to finish their work. Both for resource protection and practical construction considerations, it is preferable to limit grading projects to the regulated construction season.

Recommendation: Do not amend the code.

2. Modified K.C.C. 21A.24.240A to not require compensatory storage at the same elevation and not require that it be hydraulically connected.

Evaluation:

- Three projects were able to locate compensatory storage at elevation from the same site on one nearby farm.
- Three projects will receive partial compensatory storage from this same site, with one or two vertical feet of the project occurring at the same elevation.
- Three projects were initially able to locate some or all compensatory on site but not at the same elevation. In one instance, the identified soil turned out to be unusable for a pad and would have to instead be hauled out of the floodplain. In another, the top soil has to be excavated and set aside, the lower soil horizons taken for the pad, and then the topsoil re-spread on that area. In a third site, topsoil must be removed and a seasonal pond will be left.
- The largest project could not locate any compensatory storage.
- For those sites that located compensatory storage, it was located at a site that met the criteria for hydraulic connectivity.

Recommendation: Retain the requirement that compensatory storage be provided in equivalent volume and at equivalent elevation. Provide flexibility within that context by establishing a compensatory storage bank to provide opportunities for those sites that cannot meet this standard. See Recommendation #12 in Section V, Recommendations of the Flood-Farm Task Force, for an explanation of the bank.

3. Modified K.C.C. 21A.24.240C to allow development where the base flood depths exceed three feet or the base flood velocity exceeds three feet per second.

Evaluation: This modification was important to the success of the demonstration project, as most of the pads are in areas exceeding a depth of three feet. The standard is intended to help guide new land uses away from areas of highest risk. However, the demonstration project involved existing agricultural land uses, and serves to reduce the known hazard to that existing use. Modification of this standard is reasonable as it allows reduction of hazard where the risk is greatest.

Recommendation: Amend K.C.C. 21A.24.240C to allow limited agricultural exceptions to the required depth and velocity standards, and to waive the associated requirements for analysis. See Recommendation #7 in Section IV: Recommendations of the Flood-Farm Task Force, page 23.

4. Modified K.C.C. 21.24.240K to allow up to 40,000 square feet of cumulative encroachment if compensatory storage at elevation was not available;

Evaluation: Because many of the farm pads were constructed without providing compensatory storage at the same elevation, approximately 24,000 square feet of cumulative encroachment was used. Only three of the pads could have been constructed without this code flexibility.

Recommendation: Allow the remaining 16,000 square feet of cumulative encroachment to be used while the compensatory storage bank is being developed. See Recommendation #12 in Section IV: Recommendations of the Flood-Farm Task Force, page 24. This will be addressed in the Compensatory storage bank.

5. Modified K.C.C. 21A.24.260 to allow repair and configuration to existing livestock flood sanctuaries in the FEMA floodway.

Evaluation: The construction of the farm pads in the demonstration project would have been prohibited without this code flexibility.

Recommendation: Amend the code to allow farm pads in the FEMA floodway. See Recommendation #6 Section IV: Recommendations of the Flood-Farm Task Force, page 22.

6. Modify K.C.C. 21A.24.270 to not require an elevation certificate prior to issuance of a letter of completion for the project.

Evaluation: Elevation Certificates provide critical elevation data to ensure the farm pads are constructed to proper elevations above based flood elevation levels. Elevation Certificates will be provided for the farm pads constructed under the demonstration project. .

Recommendation: Do not amend the code.

7. Allowed modification of the standards in the Farm Plan Public Rule that pertain to livestock sanctuaries.

Evaluation: The Farm Plan Public Rule standards augment the code. Relaxation of some of the standards was necessary to accomplish the project. Any permanent changes in code will have to be reflected in the Public Rule.

Recommendation: Amend Farm Plan Public Rule to reflect any changes in code.

8. Required recorded non-conversion agreement

Evaluation: All the participating landowners agreed to execute a non-conversion agreement recorded on the title to the parcel on which the pad was located. The agreement states that the farm pad will only be used for agricultural purposes and that it may not be converted to any other use. However, the Task Force agreed that agricultural buildings should be allowed

on farm pads and that an investment in a building required that it have other agricultural uses, and not only storage during floods. The primary concern is that the allowance of a building does not lead to any non-agricultural use, especially residential use, which is prohibited in the FEMA floodway by state law.

Recommendation: Require a non-conversion agreement to be recorded for any new farm flood pad that indicates it will remain in agricultural use and conversion to non-agricultural purposes is prohibited. See Recommendation #10 in Section V; Recommendations of the Flood-Farm Task Force.

D. Additional Information Directed by Section 4, Subsection I of Ordinance 15883:

1. A complete inventory of all existing livestock flood sanctuaries in the Snoqualmie and the parcel number on which they are located.

The map in Appendix A includes 22 farms that are thought to have had a livestock sanctuary exempted in the early 1990s. (Two of these were in the Demonstration Project and therefore have star. Records from the original livestock sanctuary exemptions are incomplete. There is difficulty in identifying the exact location of several of these: either they were never built or have been modified over time. The original owners need to be located to better understand the situation. Two of the properties have piles composed significantly of hog fuel that may not be the original sanctuary.) The chart in Appendix B includes the number of the parcel on which the livestock flood sanctuary is or was located. The map also includes any farm pads that were elevated in this project. Appendix B also includes their parcel number; as well as any other known farm pads.

2. The size and base flood elevation of each livestock flood sanctuary.

Appendix B includes an estimate of the top square footage of each livestock flood sanctuary; and an estimate of how its top elevation relates to the base flood elevation.

3. An assessment of the need for new livestock flood sanctuaries and an assessment of the need for farm pads, ... including an evaluation of the alternatives to fill.

a. The Need:

The following data represents what is known on the limited option of “farm pads.” The need was assessed by a mapping exercise in which the WLRD Agriculture Program staff and the KCD farm planners put their collective knowledge of farms on a map (Appendix C) and also initiated personal contact with landowners. While this work is not entirely complete, the assessment and the map represent a significant amount of knowledge about “farm pads” in the valley.

The findings include:

- i. Farms that have high ground or adequate farm pads:

- Many farms at the edge of the floodplain have high ground – an area on their property that is above the base flood elevation where livestock, equipment and supplies can be taken - and do not need a farm pad or an alternative to a farm pad. The accuracy of this assessment needs to be confirmed by speaking with all landowners and only some have been contacted. The farm acreage associated with high ground is shown on the maps in Appendix C, and represents approximately 50% (6,600 acres) of the active farm acreage in the Snoqualmie Valley APD.
 - In addition to the farms that have natural high ground, some farms have an adequate farm pad. Once the demonstration project is completed, 16 farms will have farm pads above the Base Flood Elevation (BFE). This represents 12 % of the active farm acreage in the APD.
- ii. Farms that need a flood safe location or farm pads:
- Eleven farms have a farm pad that either straddles the BFE (not level) or is within a foot and a half of the BFE. They have flood protection for all but the most severe events.
 - Five farms have a pad that is well below BFE.
 - Nineteen additional landowners have expressed a need for a farm pad, three of whom received exemptions as an original “livestock sanctuary” but were originally constructed below BFE or whose pad was removed or never completed.

The farms that need to elevate pads or find a flood-safe location represent 2,250 acres of the active farm acreage in the APD.

b. The Survey of Farmers

The Task Force decided that it might be short-sighted to simply ask the question “what is the need for farm pads.” Consequently, a survey (Appendix D) was mailed to 150 properties in the Snoqualmie Valley APD to determine what all the potential needs of agriculture for safe, dry places or for expanded infrastructure that may want a farm pad or elevated building. Only ten farms responded, although staff received additional information by speaking directly with additional landowners and the responses were useful. Some people do take a few livestock to other places that have high ground; others report that this is a challenge that cannot be conducted frequently or for long duration. The survey also found that landowners are willing to elevate buildings though some will not have the capital for this and in other instances an elevated structure will not work for their specific farm operations.

c. The Future Demand for Flood-Safe Locations

If farming expands in the valley, there may be an additional need for flood-safe locations/options. The expansion would occur if the over 1600 acres that is now out of production or under-utilized were to be brought into production, or if farms are segregated into smaller parcels. Some of these may have access to high ground, but it is likely that some parcels will require at least a small on-site flood-independent location in order to establish a viable agricultural operation. The

“new agriculture”, the vegetable and flower production that is coming into the valley, can be viable with 10-acre holdings.

- d. Alternatives to Fill.
 - i. Floating structures were researched to the extent allowed by the time frame. (see Appendix F). They were dismissed for the near term as expensive or operationally unfeasible.
 - ii. Farm pads with flow through culverts were suggested by the Roads Maintenance representative to the Task Force and will be further explored. See Recommendation #15 in Section V: Recommendations From the Flood-Farm Task Force. A farm pad design that includes culverts as flow through devices could reduce compensatory storage needs by at least 50%. Orientation of the culverts for conveyance would have to be considered.
 - iii. Elevated structures provide the best alternative to fill. While they may cost more at the time of construction, they also keep the floodplain free for conveyance and flood storage – a long term necessity for agricultural viability. They have significant farm advantages that include: new structures can be designed and sited in a location that is suitable for current operations, are safe from flooding, and would receive insurance benefits through reduced premiums. Examples of cost are provided in Appendix G. Many farms had elevated structures historically. The Task Force recommends financial incentives to support farmers in employing this alternative whenever it is feasible. See Recommendation #3 in Section V: Recommendations From the Flood-Farm Task Force.

4. A determination of the impact on the available compensatory storage, backwater effects and base flood elevation as a result of this demonstration project.

The ordinance directed that the DNRP complete hydraulic modeling for compliance with flood hazard regulations. Staff did this work using the base model created by Northwest Hydraulic Consultants in a new Flood Insurance Study completed under contract by DNRP in 2006. This HEC-RAS model is the basis for preliminary Flood Insurance Rate Maps that were made public on September 28, 2007. This is a sophisticated model that well represents the hydraulics of the lower Snoqualmie River floodplain with flood hydrographs in an unsteady state simulation of conditions in a branched flow network.

DNRP staff modified the HEC-RAS model to include 13 specific farm pad alterations that were proposed for inclusion in the demonstration project (only ten of these have been or will be constructed). Model results for pre- and post-project conditions were compared for each of these 13 pad alterations individually, and for all 13 pad alterations collectively. Water surface elevations and energy grade elevations were compared at every modeled location for each modeled condition. All of the differences rounded to 0.00 feet, meaning that the impacts do not involve a measurable rise in the surface water elevation as defined by King County code.

The model did show some sensitivity to the demonstration project alterations. Model results included some minor rise in both calculated water surface and energy grade near most of the pad sites. At two of the sites these rises were almost measurable, as defined by the code, but none actually met or exceeded that threshold.

The unsteady HEC-RAS modeling technique used for the demonstration project accounts for both the conveyance obstruction (i.e., backwater effects) and the storage displacement associated with the modeled alterations. Neither of these types of impact would result in a change in base flood elevation as a result of this demonstration project.

It is important to note that compensatory storage was provided for three of the demonstration project pads. None of these compensatory storage mitigations were included in the model. Presumably, the mitigations would further reduce the cumulative hydraulic impact of the demonstration project, increasing the confidence that no measurable rise will result.

Finally, it is important to remember that the 13 alterations that were proposed and modeled had been relatively small dimensions. When similar construction has been allowed in previous years, the constructed pads were several times larger. The model results for these 13 small pad alterations should not be misconstrued to suggest that all such pads are hydraulically negligible. That suggestion does not logically follow from the available data. If larger pads were modeled, such as those from the 1990 project, they might have measurable adverse hydraulic impacts.

5. An identification of possible funding assistance in the form of grants or loans for farmers that could be used for alternative flood protection solutions that would not require placing additional fill in the floodplain.

Federal flood mitigation grants available to assist with elevation projects:

- Pre-Disaster Mitigation (PDM): awarded on a competitive basis and without reference to state allocations, quotas, or other formula-based allocation of funds.
- Flood Mitigation Assistance (FMA): Available for structures insurable under the NFIP.
- Hazard Mitigation Grant Program (HMGP): Provides grants after a major disaster declaration.

State flood mitigation grants available to assist with elevation projects:

- Flood Control Assistance Account Program (FCAAP): Provides mitigation funding for the protection of human life and property from flood-related events.

Local Funding Options:

- Surface Water Management Fees: SWM fees are already used to alleviate some flooding that may be related to upslope drainage or runoff through the Agricultural Drainage Assistance Program that helps with drainage

maintenance. They are also used to monitor stream flows into the APD. The Neighborhood Drainage Assistance Program has been reduced significantly in recent budgets due to declining revenue. In some cases technical advice can be offered to the property owner on how they might pursue fixing the problem themselves.

- King County Flood Control Zone District: See Recommendation #3 in Section IV: Recommendation of the Flood-Farm Task Force on possible funding from the District, page 23.
- King Conservation District: KCD members of the Task Force report that they will look at possible cost-share grant opportunities.
- King County Current Expense Funds: The Task Force suggests that CX funds are appropriate for helping agriculture to meet the County’s floodplain management standards.

E. Evaluation of Alternative Review Process

1. Alternative fees and review process:

Evaluation: DDES capped the fees at \$500 for a Shoreline Exemption and did not require a grading permit; conducted a grouped pre-application; and issued and reviewed a shoreline exemption for the entire group at once (“batched review”).

Recommendations: These fee reductions and batched review used for the demonstration project are not recommended as a permanent change. However, DDES already provides a 50% reduction in the hourly review costs for agricultural landowners and caps the cost at fixed fee for agricultural grading permits and counter service fees. As a result the estimated DDES permit fees for a landowner to construct a farm pad would be (details in Appendix E):

Less than .2 acres in area:	\$1537	(DDES Actual Cost \$7015)
More than .2 acres	\$2986	(DDES Actual Cost \$8464)

2. Hydraulic analysis and environmental review:

Evaluation: WLRD’s River and Floodplain Management Unit conducted the zero rise floodway analysis and the compensatory flood storage analysis, building a model and conducting the analysis for each farm pad individually and as a group; the total cost for these analyses was approximately \$10,000. The short time frame forced permit decisions to be made on the basis of preliminary analyses, which were done without the detailed survey information that is necessary for regulatory compliance. Additional analyses will be required before all regulatory compliance measures are met. The estimated cost is approximately \$5,000 to have a consultant conduct the zero rise floodplain and compensatory storage analysis for an individual site.

WLRD’s Watershed and Ecological Assessment Team conducted the environmental review process, going into the field to assess each site for wetland, stream or wildlife issues. The estimated cost for environmental review is \$800 per individual site if environmental review is required on a site. This does not include the cost of a consultant should one be required.

If the costs of the hydraulic analysis, environmental review and permitting are not made affordable, it is likely that projects will not be done effectively or will not be done at all and agricultural enterprises will not be viable.

Recommendation: The County should make it a priority to identify mechanisms that will make costs more affordable or to find sources of funding to cost share the expenses. One possibility is to use a portion of the funding from the King County Flood Control Zone District that is being recommended for cost sharing barn elevation mitigations to pay WLRD staff to conduct the hydraulic modeling at a much lower cost than a consultant. This form of cost-shared technical assistance would be comparable to other forms of County technical assistance provided through the Agricultural Drainage Assistance Program or the Livestock Management Program.

3. Identification of compensatory storage and outreach to landowners:

Evaluation: WLRD's Agriculture Program and GIS unit identified compensatory storage opportunities (based on topography), and the River and Floodplain Management Unit provided field review and confirmation. WLRD's Agriculture Program conducted outreach to landowners, provided assistance with the shoreline exemption applications, and recorded the required covenants for the farm pads.

Recommendation: Continue to fund the WLRD Agriculture Program staff to provide outreach, technical assistance, education, and permit coordination on county regulatory and incentive programs. Work with the King Conservation District to utilize their expertise. Continue to fund GIS staff to help identify potential compensatory storage opportunities.

4. Elevation benchmarks and elevation certificates:

Evaluation: KCD and NRCS provided surveyed elevation benchmarks, technical assistance on farm pad construction and finishing. The KCD was able to pay for it this time but will not necessarily pay for it in the future. However, KCD relies on the expertise of the NRCS for these tasks; in this case the work was performed by staff from the Snohomish Conservation District. Their participation in this demonstration project was helped by DDES' batched permitting. Their capacity to help on an individual basis will vary according to their work load. The KCD provides financial cost share to landowners as they can. However, competition for KCD's limited financial assistance resources will need to be balanced against other requests beyond flood mitigation projects.

Recommendation: Support continued funding for the KCD.

III. AGRICULTURE TASK FORCE (MOTION 12559)

The King County Executive was directed to convene a task force to review and make recommendations on farm protection measures related to flooding in the Snoqualmie Valley

APD. A Task Force of twelve individuals and one facilitator met for seven half days and one all day meeting between October 15th, 2007 and January 9th, 2008. Twelve other people attended some of the sessions to observe, contribute, or to make formal presentations. As outlined by Motion 12559, the following groups or agencies participated in the Task Force:

- Agriculture Commission (one farmer, plus an alternate);
- King Conservation District (KCD) (Supervisor and farm planner); and
- Hmong Community (one farmer, plus an alternate).

In addition, representatives from the following groups were invited:

- Sno-Valley Tilth;
- Federal Emergency Management Agency (declined);
- Washington State Department of Ecology;

Others were invited according to agenda topic:

- University of Washington Climate Impacts Group;
- U.S. Department of Agriculture;
- A farm contractor; and
- Snohomish County Surface Water Utility.

A. Findings of the Flood Farm Task Force.

The following specific topics that Motion 12559 requested that the Task Force address the following specific topics:

1. Expansion of the opportunities to construct farm pads to protect livestock, equipment, and products such as seeds, bulbs, hay or other feed during floods.

Findings:

- Federal and state regulations do not prohibit farm pads in the designated FEMA flood-way, but do require that any fill placed within the FEMA floodway does not result in an increase in the base flood elevation.
- King County code prohibits livestock flood sanctuaries in the designated FEMA floodway.
- Floodplain management for No Adverse Impact requires compensating for fill placed in the flood plain by removing material from the same elevation.
- The location of one farm pad or a cluster of farm pads could trigger a variety of unintended hydraulic impacts that can not be accurately predicted until the farm pads are assessed through hydraulic modeling.
- Elevated buildings, farm pads, or any alternatives to farm pads are critical components of agricultural operations in the Snoqualmie APD because the entire valley farmland is inundated three to five times a year. This is a unique situation for Snoqualmie farmers compared to competitors in the Skagit, Snohomish or Green River flood plains.

Recommendations:

- Amend King County code to allow farm pads in the FEMA floodway if compensatory storage and zero-rise standards are met.

- Allow the construction of agricultural accessory buildings on farm pads provided a covenant assures the farm pad and the buildings will not be converted to non-agricultural uses, including residential, which is prohibited in the FEMA floodway under both State and King County regulations.
- Identify sources of funding to assist farmers to implement projects and/or meet the regulatory requirements.
- Establish a compensatory storage “bank” to support the viability of agriculture in the Snoqualmie Valley. See recommendation #12 in Section IV: Recommendations of the Flood-Farm Task Force., page 24.

2. Ability to repair flood-damaged building regardless of the assessed value.

Findings:

- Federal and state regulations require that when a structure is “substantially improved,”(improvements exceeding 50% of the market value of the structure) the structure must be brought up to current code.
- Federal and state laws do not prohibit substantial improvements in the FEMA floodway.
- King County DDES had interpreted the (Sensitive Areas Ordinance which went into effect in November 1990) to prohibit substantial improvements within the FEMA floodway. The Critical Area Ordinance regulations that went into effect January 1, 2005, obviated this earlier determination which was officially reversed by the department’s Regulatory Review Committee in December 2007.
- The assessed value of many old agricultural buildings is low so that the substantial improvement threshold is also low. When an old structure needs to be brought up to current code, the cost of the upgrade can be prohibitive. Any change to the threshold for determining “substantial improvement” would require a change in federal and state regulations.

Recommendation:

- Implement the DDES Regulatory Review Committee’s recent interpretation that a substantial improvement to a non-residential building is allowed within the FEMA floodway if it meets the federal and state requirements to bring the structure up to current code.

3. Application of expanded storm drainage technology and requirements, including berms, for urban developments that contribute storm water into the Snoqualmie River Basin;

Findings:

- Flood flows in the lower Snoqualmie River valley are primarily the result of snowmelt and rainfall in the North, Middle, and South Forks of the Snoqualmie River basin, the Raging River basin, and the Tolt River basin.
- Based on available data, the increase in impervious surfaces in the lower part of the basin will have a negligible impact on the river in severe flood events. However, storm water runoff from development may explain why some agricultural fields near tributary streams flood earlier than flows from river flooding and remain inundated longer than they used to be after river flows recede.
- Tightlines from the Urban Planned Developments appear not to be the issue they were perceived to be based on available data. Redmond Ridge does not flow to the Snoqualmie. Snoqualmie Ridge and Redmond Ridge East have detention facilities that meet strict standards in King County’s Stormwater Design Manual and the discharge tightlines are for emergency overflow only.
- Berms may be effective to prevent minor flooding adjacent to small streams.
- There are no gages to measure storm water runoff from some of the small creeks and streams that flow into the Snoqualmie River.

Recommendation:

- Add flow gages on Tuck Creek and Ames Creek – the two main tributaries in the Snoqualmie that are not currently monitored for flow to further analyze and understand the hydrologic affects of tributary and stormwater impacts in the Snoqualmie Basin. Investigate the need for additional gaging. See Recommendation #9 in Section V: Recommendations of the Flood-Farm Task Force.

4. Implementation of a flood control program within the Snoqualmie Valley APD that focuses upon the reduction of flooding to farmlands.

Findings:

- Control of winter flooding by upstream control of Snoqualmie River flows would require reservoir volume in excess of those on the Cedar and Green River systems.
- Row crop farmers report that spring floods generally do more agricultural damage or inhibit viable agriculture more than the larger floods of winter months.
- Spring floods might be controlled with an upstream reservoir of more modest size.
- Prior studies by the U.S. Army Corps of Engineers and others have found problems with the most likely locations and design concepts for reservoir construction in the upper Snoqualmie Valley. With the exception of the North

Fork Dam site proposed in the early 1970s, few feasible opportunities have been identified. The North Fork proposal was vetoed by then Governor Daniel Evans primarily for environmental reasons.

- Salmon recovery planners have identified the natural, unregulated flows of the Snoqualmie River system as a unique and important benefit that is not present in most of King County’s other major river systems, making the Snoqualmie River critical for salmon recovery in the Puget Sound region.

Recommendation:

- The County should conduct a hydrologic analysis of the Snoqualmie River basin. See Recommendation #16 in Section IV: Recommendations of the Flood-Farm Task Force, page 25.

B. OTHER FINDINGS OF THE FLOOD-FARM TASK FORCE

1. Hydrologic Trends.

- There is wide variability in how the Snoqualmie River responds in a flood event.
- Factors affecting variability include: amount and location of rainfall in the basin; existing snow pack; temperatures; degree of soil saturation before the storm; and pre-flood levels in the South Fork Tolt River reservoir.
- Existing data do not indicate any significant changes in flow response in the basin, despite periods of logging and of sediment removal (dredging).
- Data indicates that the time for flood progression from Snoqualmie Falls to Carnation continues to match established rules of thumb: Carnation crests approximately 12 hours, plus or minus 6 hours, after Snoqualmie. Records from both Snoqualmie River stations (at Snoqualmie and at Carnation) are considered “good” by the U.S. Geological Survey. “Good” is defined as meaning 95% of reported measurements are within 10% of actual values.

2. Future Flood Predictions

- The predictions for the future are that there will be higher variability in storms and floods due to global climate change.
- In a mixed rain and snow basin like the Snoqualmie River that variability is more pronounced than in lowland or high mountain basins. The Snoqualmie Basin is one of the most sensitive basins to climate change on the West Coast.
- Regional warming from predicted global climate change will result in high snow levels. Precipitation that once fell as snow would fall as rain and therefore runoff will be greater.
- Historic records may require adjustment to yield useful predictions in light of climate change.
- Models indicate there will be increased winter flows but lower winter peaks flows and reduced spring flows with drier conditions in the summer.

3. Snoqualmie 205 Project Effects

- The Snoqualmie 205 Project involved channel widening done in 2004 to reduce flood problems in the City of Snoqualmie, which previously had the highest number of flood insurance claims of any city in the state. Pre-project study by the U.S. Army Corps of Engineers suggests that the project can cause about 1,500 cubic feet per second (cfs) more water to go over the falls at the peak of a major flood; later in the flood, the same study predicts a 500 cfs decrease.
- The Snoqualmie 205 Project contributed mitigation funding to raise 12 structures (7 houses, 3 barns, 1 office, 1 shop) as mitigation for downstream impacts. Total project contribution is \$328,500.
- The project contributed mitigation funding to raise 12 structures (7 houses, 3 barns, 1 office, 1 shop) as mitigation for downstream impacts. Total project contribution is \$328,500.
- Flood storage was restored as mitigation and included the removal of 90,000 cubic yards of a berm at the former Weyerhaeuser mill site. Berm removal also enhanced the river's access to a much larger area of active floodplain behind the berm.

4. Backwaters from the Snohomish/Skykomish

- Dikes in the Snohomish are now built to a uniform profile and all overtop at a 5-year event. They do not contribute to or cause a back up the Snoqualmie.
- Tidal effects can be seen as far as SR 522, where gage measurements show this tidal influence when river flows are low. In flood conditions, the gage does not show this tidal influence.
- A diary from the 1880s observed the Skykomish River back up into the Snoqualmie River, which indicates that the Skykomish has historically had a backwater effect on the Snoqualmie River.
- The Skykomish River has a very steep grade and when its flows reach the flatter Snohomish Valley floor, a hydrologic mound forms in the Snohomish Valley that can cause the Snoqualmie to back up into King County.
- The degree to which the Skykomish River backs up into the Snoqualmie depends upon the timing of the flood crests in the two basins.

5. Federal and State Regulations

The majority of the Snoqualmie Valley APD is mapped in the FEMA floodway where the most protective regulations apply.

- In the Snoqualmie River floodplain, the FEMA floodway includes some areas of deep, fast flowing, and especially dangerous waters, and it includes some areas of lesser hazard.
- Federal and state regulations recognize that agriculture requires some degree of flexibility or relief if agriculture is to occupy the floodplain. Agriculture is a compatible land use in floodplain and is recognized as a preferred land use over more intense residential or commercial development.
- Based on federal regulations, under no circumstance can the activities cause an increase in the base flood elevation within the FEMA floodway.

- Federal and state regulations allow wet flood-proofing through a variance process for agricultural buildings, or they can be allowed outright for low damage potential buildings.
- State and federal laws allow construction of new non-residential structures in the FEMA floodway as long as performance standards are met.
- Construction of new residential structures is prohibited in the FEMA floodway under state law.

6. Compensatory Storage

- Compensatory storage at elevation is essential for effective No Adverse Impact floodplain management.
- Most jurisdictions now require compensatory storage even though it is not required by federal or state regulations.
- Available compensatory storage opportunities are unusually limited by topography in the flat floodplain of the Snoqualmie River.

7. Elevating Buildings

- The cost of elevating some types of new buildings adds a relatively marginal expense to the initial construction cost.
- Elevating existing and new agricultural buildings can greatly reduce flood damages and can also result in savings in flood insurance premiums. Flood insurance premium discounts may be sufficient to recover the incremental costs borne by property owners in just few years time for some buildings.
- Federal flood mitigation grant funding can be applied to elevating buildings. However, the criteria for grants generally seek to reduce flood insurance claims, so they tend to favor homes instead of agricultural buildings.
- Federal flood mitigation grant funding can be applied to elevating buildings. However, the criteria for meeting minimum benefit-cost analysis may reduce the potential grant eligibility of agricultural buildings.
- Elevation is not feasible for some agricultural buildings that are either too old or need to be located at grade to be accessible by animals or equipment.
- Elevating an existing building that consists primarily of walls and a roof to shelter livestock or heavy equipment on the ground can involve significant cost for heavy structural flooring that is not otherwise necessary.
- The agricultural representatives state that it is cheaper to elevate buildings by importing fill. Flood management staff question this statement and have found data to the contrary.

8. Floating Technologies.

- Floating technologies tend to be used in marine tidal environments or lake environments more than in river environments.
- Designs that would address flood debris may not be ideal for a farm environment.
- The technologies explored are cost prohibitive for a single farm.

9. Miscellaneous Findings.

- Produce crops such as vegetables and flowers are not considered commodity crops. As a result, Snoqualmie farmers are not compensated by federal assistance for their losses. The Farm Services Agency staff advised the Task Force that attention should be drawn to this issue so that federal insurance funds can be available to local agriculture.
- Floods leave agricultural landowners with miscellaneous debris from upstream properties that need to be cleared from their land. The landowners have to clear the debris, haul it to a disposal site, and pay the disposal fees – all at a time when they need time and funding to recover from the flood event.
- Hazardous wastes can contaminate the food supply when transported in floodwaters. A pilot program in the basin is underway to promote safe storage, collection and disposal.

IV. RECOMMENDATIONS OF THE FLOOD-FARM TASK FORCE

The Task Force is forwarding the following recommendations for consideration by the King County Council, in no order of priority:

Recommendation 1. Allow new non-residential agricultural accessory buildings in the FEMA floodway in King County’s APDs (K.C.C. 21A.24.260C), as long as applicable standards are met.

New elevated buildings – on post and piling, not on fill – may be the best solution for both floodplain management and agricultural viability in the long term. New elevated structures provide protection, reduce flood damage, chaos, and stress, and provide lower insurance rates. Grants and cost share may be able to help defray their costs.

Recommendation 2. Allow for wet flood-proofing of some agricultural buildings through an alteration exception to the critical areas ordinance or through a code amendment.

Wet flood-proofing allows buildings to be constructed or remain at grade while requiring that permanent or contingent measures are applied to the building or its contents which prevent or provide resistance to damage from flooding while allowing floodwaters to enter the structure or area. Generally, these measures include properly anchoring the structure, using flood resistant materials below the base flood elevation, protecting mechanical and utility equipment, and the use of openings or breakaway walls. Federal law allows this provision through a variance process, which in King County would be through an alteration exception, or it can be allowed outright if certain standards are specified in King County Code. Approval would be needed from FEMA and the Department of Ecology to allow this change to code. This outright provision is generally approved only for buildings that are of relatively low value. FEMA has approved a \$65,000 limitation for such buildings in Snohomish County.

Recommendation 3. Help reduce flood impacts to agriculture by providing \$100,000 per year for 10 years from the King County Flood Control Zone District to be used as cost share for mitigation projects, such as the elevation of barns or other mitigation measures in King County APDs.

Because flood mitigation measures can be expensive, the King County Flood Control Zone District funds can provide a cost share to leverage other sources of funding, including property owner contributions. The funds may also be used to cost share the expenses of conducting the hydraulic modeling and permit expenses required for construction of new or repair of existing farm pads.

Recommendation 4. Work with the federal Farm Services Agency to propose modifications to the federal insurance programs to recognize and provide coverage for the type of agriculture that occurs in King and Snohomish counties.

Most federal crop insurance programs cover only commodity crops such as wheat, corn, and cotton. Most crops grown in King County, such as vegetables, herbs and flowers, are considered specialty crops and are not covered by federal crop insurance. The Farm Services Agency recognizes that alterations to the flood insurance program, such as reimbursing for loss of income, are needed to assist Snoqualmie Valley farmers. A representative of the agency spoke to the Task Force and encouraged our collaboration on this issue.

Recommendation 5. Add a definition of farm pads to K.C.C. 21A.06. The definition should include the storage of equipment, seeds, hay, bulbs, livestock and small animals.

This recommendation reflects the change in agriculture in the Snoqualmie Valley from the predominance of dairies in the early 1990s to the “new” agriculture centered on hay, vegetable, flower and herb production, and range-fed beef, sheep and poultry. Farm pads are needed to be more than just livestock sanctuaries; they need to provide protection for equipment and supplies as well as animals.

Recommendation 6. Allow farm pads in the FEMA floodway (K.C.C. 21A.24.260D) as long as applicable standards are met.

Since the 1990 exemption, no new livestock sanctuaries have been constructed in the FEMA floodway. The original livestock sanctuaries were sized for large dairy herds and resulted in approximately 275,000 cubic yards of fill being imported into the floodplain. If constructed today, many of them would not meet federally-required conveyance or King County’s compensatory storage standards. Farm pads needed for the “new” agriculture will generally be much smaller. The recommendation is to encourage alternative means of flood protection to minimize this import of fill, but to allow farm pad construction if the project can meet the applicable compensatory storage and conveyance standards. Changes to the floodplain regulations to allow farm pads within the FEMA floodway also require an amendment to the county’s shoreline regulations. These changes will require review from the Department of Ecology and FEMA.

Recommendation 7. Provide limited agricultural exceptions to the maximum depth and velocity thresholds. (K.C.C. 21A.24.240C).

The code amendment would give the DDES director the authority to waive the requirement for a depth and velocity analysis for agricultural uses and to approve certain projects that exceed depth and velocity thresholds.

Recommendation 8. Extend the demonstration project deadlines for the ten project participants to complete farm pad construction to September 1, 2008, and to submit the required elevation information by September 30, 2008.

The late start of these of the demonstration project process, combined with early wet weather, resulted in projects that could not be completed in the Fall of 2007. Specific factors included:

- the river was high in September and fields were wet before the exemptions were issued. Those farmers with wet fields could not run equipment in and out of them to construct the farm pads;
- there was very little fill available from contractors late in September at the end of the construction season;
- haulers were afraid of liability if they damaged county roads when turning onto or off the saturated shoulder of an unpaved farm road;
- it was too late to stabilize and hydro-seed the farm pads or to surface them with gravel or plants; and
- ideally a final certification of elevation should be done after the farm pads have a had time to settle.

Recommendation 9. Install flow gages on Tuck Creek and Ames Creek.

The addition of gages on these two streams will complete the monitoring of flows in streams that come into the Snoqualmie Valley APD and may affect the inundation of farm fields – independent of river levels. The other major streams in the Snoqualmie Basin are already being monitored. These data will be used for the hydrologic analysis proposed in ecommendation #16.

Recommendation 10. Allow non-residential agricultural accessory buildings on farm pads.

Buildings are needed on farm pads because equipment and supplies require protection from the rain as well as from floodwaters. These structures must be used only for farm operations with conditions such as the prohibition on septic systems, public use and residential use. Other conditions will be worked out by the DDES Agriculture Permit Team, which includes the Seattle-King County Public Health Department, the King Conservation District and WLRD. Outreach should specifically be targeted to the Hmong farmers, working with Hmong representatives and interpreters.

Recommendation 11. Increase public education workshops and materials for landowners on flood preparedness and flood response in order to gather more information and to convey the

progress made on improving flood protection for agriculture. Conduct outreach targeted specifically to farm members of the Hmong community.

An annual workshop could be hosted by WLRD’s Agriculture Program and supported by DDES, WLRD’s River and Floodplain Management Program, and WRIA 7 to help landowners prepare for and respond to floods. This workshop could serve as a forum to track progress on the implementation of the recommendations in this report. Other ideas include a “Guide to the Valley” document that discusses floods and the responsibility they entail, workshops for realtors to educate them on flood hazards when they market property in floodplains, and a video displayed at DDES in the permit center.

Recommendation 12. For the purposes of promoting agricultural viability, the Agriculture Program and the River and Floodplain Management Unit of WLRD shall establish a “compensatory storage bank” to the floodplain to enable easy transfer of compensatory storage between property owners and to expedite permitting.

The preservation of flood storage capacity is an essential underpinning of the nationally recognized King County strategy for safe long term management of the floodplain. The standards do not outright prohibit all floodplain fill, but rather require compensatory storage for any displacement. This allows some flexibility for floodplain development without allowing adverse impacts to neighboring properties. However, the lower Snoqualmie Valley APD is one area where the standard offers little opportunity for compensatory storage opportunities: there is limited high ground that could be excavated to compensate for adding fill into the floodplain. The Task Force recommends that the County:

- Continue to protect floodplain storage capacity by requiring that compensatory storage be provided in equivalent volumes at equivalent elevations to those being displaced.
- Establish a “compensatory storage bank” to facilitate agricultural and important public projects while continuing to protect the flood storage capacity of the floodplain.
- Open the bank with an initial balance equal to the unused remainder of the 40,000 square foot allowance for unmitigated flood storage displacements established by the 2007 Demonstration Project, equal to approximately 16,000 square feet.
- Supplement the bank balance with an additional deposit to represent an allowable additional storage loss that would appear to satisfy the county’s zero-rise threshold, according to proposed computer model simulations of hydraulic impacts. The estimated time frame for completing this analysis is June 30, 2008.
- Locate and quantify potential contributors to the bank such as, Chinook Bend levee removal, King County Department of Transportation roads maintenance activities, etc.
- Explore options with DNRP for design of the north Snoqualmie Trail Extension to determine whether there are any options that might contribute compensatory storage to the bank, such as lowering, narrowing or elevating some portions of the trail. Any outcome would have to recognize the importance of the trail as not only essential to the Regional Trail System, but as an essential public facility, and the additional costs of constructing and maintaining the trail under any reconfiguration as a public

- investment. A major constraint may be the Trans-Continental Fiber Optic Cable that is located with the trail fill.
- Explore whether there is any opportunity to obtain compensatory storage from locations in Snohomish County.

Recommendation 13. Develop a plan to coordinate cleanup and disposal of miscellaneous post-flood debris among the various entities – contract haulers, the Solid Waste Division, Duvall, and Carnation. The County should support basin-wide programs, including collection and safe storage, to reduce the possibilities of hazardous waste coming in contact with floodwaters.

In the last flood, haulers voluntary offered clean up services in the Duvall area and King County Solid Waste cancelled disposal fees. However, there is no official plan coordinated among the various entities. Landowners end up cleaning up the debris deposited on their land from upstream landowners, and they cover the hauling and disposal fees. This happens at the same time that they need to be spending time and funds on flood recovery in their own operations.

The King County Local Hazardous Waste Program is conducting a pilot program to reduce hazardous waste in the basin. Farmers are very supportive of this effort because it will help abate concerns about potential adulteration of food by floodwaters. The Task Force members would like to see this program continued and strengthened.

Recommendation 14. Examine the feasibility of establishing secure locations for seasonal storage of equipment or livestock outside the floodplain or during flood events.

Historically some agricultural landowners take equipment and livestock out of the floodplain, either for the season or during flood events. Many relocate livestock and equipment to land of a neighbor, but this option has its limitations. People want a secure location where their equipment and livestock are safe. Livestock need oversight, some degree of quarantine and care. County staff, farmers, the KCD, Task Force members and survey respondents all provided evidence that many people currently use this option for part of their flood protection need. However, because some fields are frequently flooded during the winter and spring, and if floods become more frequent, this option diminishes. Moving livestock once every two years in an emergency is tolerable; moving them chronically three or four times a year – whenever the river rises – presents an entirely different logistical challenge.

Recommendation 15. Investigate the feasibility of constructing farm pads with flow-through devices such as culverts.

This idea may require only half the compensatory storage and may address conveyance issues at some sites. Further work is needed on costs and hydraulic modeling to determine if the benefits outweigh the costs.

Recommendation 16. Conduct a hydrologic study of the Snoqualmie River Basin.

Hydrologic simulation of the basin would allow a more thorough understanding of many concerns developed elsewhere in this report. The model could help to better quantify the cumulative impacts of changing land use in the basin, which is often blamed for flood problems in the Snoqualmie Valley APD. The model may also help to improve flood warning capabilities, and serve as a planning tool for future flood reduction projects.

V. Other Ideas to be Noted but Not Recommended

The ideas listed below were suggested by members of the Task Force as potential solutions but were generally considered infeasible because of constraints such as cost, impacts on environmental resources, or were beyond the scope of the Task Force’s roles. However, some Task Force members wanted these ideas to be included in this report.

A. Comparisons to Regulations in Snohomish County.

Snohomish County has mapped a “density fringe” for agricultural lands within the Snohomish River floodplain. Under this approach, each farm is allowed to fill 2% of their land for agricultural purposes. The agricultural representatives on the Task Force expressed the desire to adopt a similar mapping and regulation approach.

The Task Force representative from the Department of Ecology stated that the “density fringe” was approved for Snohomish County because of the tidal influence on the lower Snohomish River that is not present in King County. Because of this tidal influence, Snohomish County has constructed an extensive dike system, which disrupts the natural storage and flow of floodwater. In addition, these dikes only provide protection to the five-year storm and are designed to be over-topped at those flood levels.

King County proposes to provide flexibility for farmers through the establishment of a compensatory storage bank and is optimistic that this will help the agricultural community meet the compensatory storage regulations, which Task Force member agree are valuable floodplain management standards. Additionally, the County is finding ways to support the elevation of buildings – the preferred long-term option for agricultural viability and floodplain protection.

B. Pump Carnation Marsh to Provide Flood Storage During Flood Events.

This concept could provide additional flood storage volume that would be available before the onset of a flood. However, the marsh is on relatively low-lying ground that is not isolated from the river by levees, railroad grades, or similar impervious features. For these reasons, it is unlikely the marsh could be pumped down without significant investment in infrastructure to facilitate pumping. Furthermore, the marsh would probably fill in the early hours of a flood, providing little benefit in the later hours when the damaging crest arrives. Also, this proposal would adversely impact rearing habitat for multiple salmonid species, including Endangered Species Act (ESA) listed Chinook salmon and steelhead trout.

C. Prioritize and Schedule Five Sediment Removal Sites in the Snoqualmie Basin in Accordance with Flood Plan Policy.

Consider the two sites on the mainstem Snoqualmie River channel (below the Raging River and below the Tolt River) as the highest priorities for agriculture.

Proposals such as these are being examined under the umbrella of the new Flood Management Plan. However, there would not be significant flood relief from these proposals. Since these two areas account for over 50% of ESA listed Chinook salmon spawning grounds, and for a fairly large portion of ESA listed steelhead trout spawning grounds, there are significant environmental challenges associated with removing this gravel. Thus, these two sites will likely score very low in terms of priorities for the controversial issue of sediment removal on the river.

D. Raise the West Snoqualmie River Road in Locations That Make it Impassable at Lower Flood Stages.

This would entail significant costs for the benefit of few landowners. Road project funds are extremely limited and this project would likely be a low priority compared to other public safety needs when determining how these limited resources will be used.

E. Hire a Consulting Firm to Analyze Feasibility of Multipurpose Flood Control Dams and Reservoirs.

First analyze the capacity necessary to reduce flooding in a way that would make a difference to agriculture, by determining what flood levels are acceptable for agriculture.

Recommendation 16 begins part of the process needed to undertake this proposal by recommending collecting and modeling necessary background information. However, it does not address that natural flooding levels benefit ESA listed salmonid habitat. Attempts to install any dam within the Snoqualmie Basin would face significant environmental challenges.

F. Provide compensatory storage by elevating some of the Snoqualmie Valley roads on pilings.

As in Idea D, this would entail significant costs and would likely be a low priority use of limited road project funds.

VI. Framed Issue: New Farm Houses in the FEMA Floodway

One item the Task Force addressed, which some members of the Task Force suggested as a recommendation, is not being carried forth as a recommendation of this report. The Task Force did not reach consensus on allowing new residential farm houses in the FEMA floodway, however it is important to recognize that this issue was not fully discussed or

explored. New residential homes, including farm houses, are not allowed in the FEMA floodway by state law and King County code.

The agricultural representatives of the Task Force wanted to recommend that the King County Council should endorse a farmer-initiated proposal that State Legislators amend State Law to allow new residential farm houses to be built in the FEMA flood-way of APDs (such as Snoqualmie Valley) that are not protected by levees or dikes, provided that they meet appropriate requirements.

They argue that the County has expressed a desire to support “family farms” and thereby provide the community with the social, cultural, and economic benefits that local family farms provide. Agricultural representatives to the Task Force believe that giving farmers the opportunity to live on their farms is essential to the existence of these small family farms.

Farmers further argue that because the flows during floods are not of high velocity in all parts of the Snoqualmie floodway, it is not too dangerous to locate a house in the floodway if it is elevated above the flood level.

The recommendation of King County staff is to preserve the prohibition of new residential homes in the FEMA floodway. Staff believe that the floodway is generally thought of as the corridor of deepest, fastest flow. From a state-wide perspective, this general understanding is reasonably accurate, although the methods used to define the floodway do not always correspond with the deepest and fastest conditions. In general, the floodway would be a very dangerous place to live.

The existing state law has saved lives and prevented property damage by keeping people out of areas that are truly unsafe. Unless the state can more precisely map areas of extreme flood risk, the floodway should continue to be considered as the most hazardous subset of the floodplain where residential construction remains prohibited.

A State legislative process would be expensive and lengthy, and require many years of work. It would open a “Pandora's Box” for those with less sensitivity to the flood issue and this could put far more people in harm’s way. With floods perhaps increasing in both frequency and magnitude, King County staff believes this is not a wise direction.

VII. CONCLUSION

For effective long-term management of floodplain functions – which will benefit the viability of agriculture in the long term – alternatives to placing fill in the floodplain are the solution of choice. Agricultural landowners need protected storage opportunities that are elevated above the base flood elevation. The protected storage can be provided by options that do not require fill, such as elevating existing buildings, constructing new elevated buildings, or taking equipment and supplies out of the floodplain for the flood season. Importing fill is the least desirable option.

A suite of options must remain open for agricultural landowners to both contribute to long term floodplain protection and to protect themselves individually during floods. The agricultural community will need support to help them meet the regulations that will provide the flood protection they need. The key to success is ongoing dialogue.

Staff will meet with the agricultural members that were on the Task Force to report on such items as the status of the modeling for the compensatory storage bank, the outcome of the fully completed demonstration project proposals, the legislative package related to these proposals, and any further information on agricultural needs. In addition, staff will provide an annual update to the King County Agriculture Commission on the issues addressed in this report.

The Executive will evaluate the code changes recommended by this report and forward appropriate legislation by April 30. Changes to the floodplain regulations to allow farm pads within the FEMA floodway also require an amendment to the county's shoreline regulations. This latter code amendment is part of the larger shoreline code rewrite which will not be completed until later this year. This also will require approval from Washington Department of Ecology. We understand farmer's expectations regarding work that might be done in the summer of 2008, however any work planned for this summer should not assume flexibility from current regulations could be provided by these code changes.

This report has taken an immense effort from agricultural representatives, including the King Conservation District and King County managers and staff. However, there was a very short time frame and the Task Force members recognize that some report items may be lacking in adequate details.

Farmland Preservation Program

Farmland Preservation Program

Program Description and History

November 6, 2009 was the 30th anniversary of the Farmland Preservation Program (FPP). The FPP, which purchases and holds farmland development rights in perpetuity, is one of the oldest preservation programs in the United States. Since 1984, when the first development rights were purchased, the FPP has been a corner stone for agriculture in King County. The FPP ensures that at least some of the county's remaining prime agricultural land will always stay undeveloped and open and available for agriculture.

Program Description

The Farmland Preservation Program (FPP) is a voluntary program that purchases the development rights from farmland in order to permanently preserve it for agriculture or open space uses. In selling their development rights, property owners grant the county the right to place covenants on their property that restrict its use and development. The covenants are contained in an agricultural conservation easement known as the Deed Of and Agreement Relating to Development Rights (Deed and Agreement). The Deed and Agreement is both an easement and a contract as it places restrictive covenants on the property and imposes contractual obligations on both the property owner and the county.

King County holds the development rights in trust on behalf of the citizens. The covenants that are placed on the property are in perpetuity; they “run with the land” and remain in effect even if the property is sold, rented, bequeathed or annexed by another jurisdiction. The covenants restrict the land to agricultural or open space uses, permanently limit the number of dwelling units and require that 95 percent of the property remain open and available for cultivation. Although the covenants do not require that the property be actively farmed, they prohibit any activities that would permanently impair the use of the property for agriculture.

How the FPP Began

The FPP officially began in November, 1979 when county voters passed a \$50 million Farmlands and Open Space Bond Initiative that authorized the sale of bonds to finance the purchase development rights on high quality farmlands. Ordinance 4341 (codified as Chapter 26.04 of the King County Code) outlined the objectives and parameters of the FPP and instructed the Executive to put the bond initiative before the voters. The Ordinance recognized the economic, aesthetic and unique benefits that agriculture provides to the citizens of King County and stated that land suitable for farming is an irreplaceable resource. The Ordinance acknowledged that current policies and regulations (i.e., in 1979) did not provide adequate protection and that the permanent acquisition of voluntarily offered interests in farm and open space lands would provide long-term protection of the public interests which these lands serve.

Ordinance 4341 and the Bond Initiative obligated the county to hold the development rights in trust, on behalf of the citizens of King County, in perpetuity. They also required that, if the Council were to find that any of the lands or interests acquired with bond proceeds could no longer fulfill the public purposes described in the ordinance, the Council would submit to the voters a proposition to approve of the disposition of such lands or interests. Only upon a majority

vote approving such proposition, could the county dispose of any land or interest. To-date, no lands or interests have been found unable to fulfill the public purposes that were described, and the only loss of development rights has been through condemnation.

Purchase of Farmland Development Rights:

During the mid-1980s, the county accepted offers to purchase the development rights on 12,600 acres. Although most of the funds generated by the 1979 Farmlands and Open Space Bonds Initiative have now been spent, the county has continued to acquire farmland development rights using funds generated by the Conservation Futures levy as well as with federal and State funding. Since 1987, development rights have been purchased on 489 acres and the development rights on 52 acres have been donated to the county. An additional 121 acres have been acquired in fee. Adding these acres to those acquired during the mid-1980s brings the total acreage of permanently protected farmland in King County to 13,337 acres.

Managing the Farmland Preservation Program

In 2009 King County had 1.4 Full Time Employees dedicated to managing the county's farmland development rights interests. Management of these interests (i.e., the Farmland Preservation Program-FPP) includes the following activities:

- Policy development and implementation. FPP staff develop and implement policies for managing the FPP. Written policies have been developed for determining the permissibility of various uses of FPP property, including the use of FPP property for utility easements and for rights-of-way. Policies have also been developed regarding habitat restoration and enhancement activities on FPP property. Implementation of various policies may require that they be approved by the King County Council. The restrictive covenants that are placed on properties to preserve them for agriculture have also been recently updated and revised to be more compatible with the needs of contemporary agriculture.
- Interpretation of the restrictive covenants. Although the covenants that are contained in the Deed and Agreement were written to be as specific as possible, questions occasionally arise concerning their interpretation. FPP Staff periodically consult with the King County Prosecuting Attorney to ensure that the covenants are interpreted in a consistent and legally defensible manner.
- Property monitoring. FPP staff monitor properties by conducting site visits and meeting with the property owner(s) to ensure compliance with the restrictive covenants. Farmland Preservation Program (FPP) staff regularly monitor FPP properties to ensure that the owners are aware of the restrictive covenants and are complying with them. Monitoring activities include site visits and meeting with the property owner as well as routinely driving by properties.
- Application review. FPP staff review applications for building, grading, boundary line adjustments and other alterations of FPP properties to ensure that the proposed alteration is consistent with the covenants. Staff also review requests for easements across FPP property. Council approval may be required depending on the extent of the requested activity.
- Record maintenance. FPP staff update and maintain other records pertinent to the county's development rights interests.

Trends and Challenges Affecting the FPP

FPP properties are generally reflective of other agricultural properties in the county. The changes and trends that are noted in this report also affect the county's preserved farmlands.

Increase in Number of Farms and Separate Ownerships

As the number of farms in the county has increased so has the number of farms that are in the FPP. The county originally purchased development rights on 187 separate ownerships during the 1980's. Since then, the county has acquired development rights on 17 additional farms. Besides purchasing more development rights, many of the farms that originally consisted of several parcels have been broken up and the parcels have been sold separately. As a result, by the end of 2008, FPP properties were under 260 separate ownerships. Staff estimate that approximately two thirds of FPP properties have changed in ownership since the development rights were acquired. Besides selling parcels separately, the entire property may have been sold or, since some of the owners who originally sold the development rights are now deceased, the property has been passed on to their heirs.

Changes in property ownership presents challenges for the FPP. In many instances FPP staff are working with owners who acquired the property after the development rights were sold. Not having received any compensation themselves, these owners are often somewhat unfamiliar with the FPP and the restrictions that have been placed on their property. Staff are frequently surprised by the lack of information that new owners have about the covenants and sometimes it appears that they have not even read them. Ensuring that property owners are familiar with the covenants and the restrictions that they impose is the most effective way of keeping FPP properties in compliance with the covenants. Monitoring staff make sure that new owners of FPP property have a copy of the covenants and they point out those that are most likely to affect their use of the property.

Adjusting boundary lines between parcels or selling parcels separately may also create unintended consequences. FPP properties are subject to a 5 percent non-tillable surface allowance that is calculated as 5 percent of the total area of all of the parcels that comprise the property. If a property consists of several parcels, and if the amount of non-tillable surface on any one parcel is at or near the 5 percent limit for the entire property, then there will be little or no allowance remaining for use on the other parcels. FPP property owners may be unaware of the implications of this restriction if they are unfamiliar with the covenants.

Statistics compiled by FPP monitoring staff show that within the 3-year period of 2006 – 2008, 15 percent of the FPP properties that were visited had a least one covenant violation. The most frequent violations noted involved dwelling units; either the number of dwelling units exceeded the allowable limit or the occupants were not family members or associated with farming activities on the property. In addition to the covenant violations regarding dwelling units, monitoring staff also reported informally resolving other violations. Often, more than one site visit is required to ensure that a violation has been adequately resolved and monitoring staff reported that during the above 3-year period, more than one site visit was required for 30 percent of the properties.

Property monitoring is one of the FPP's most important activities. The enabling legislation for the FPP stated that King County would hold the development rights in trust on behalf of the citizens and monitoring is necessary in order to uphold this obligation. It is very strongly recommended that the county maintain staffing levels sufficient to allow periodic monitoring of the preserved properties.

Changes in Agricultural Use

Agriculture in King County has undergone significant changes since the FPP began in 1979. Socioeconomic factors, such as increased land prices and costs of living, challenges in finding and providing for required labor, potentially conflicting land use practices and increased demand for water and water rights all have potential adverse impacts on the long-term viability of farming in King County and the ability to keep FPP properties actively farmed.

While these forces present challenges to preserving and promoting King County's farming tradition, other opportunities have emerged to promote local farming. The demand for market crops and value-added products has increased dramatically and new means have emerged to allow farmers direct access to consumers throughout the Puget Sound area. Additionally, recent changes to the King County Code have supported value-added processing and direct marketing of farm products.

The use of FPP properties reflects the changes in types of agriculture in the county. King County originally purchased development rights on 62 dairies which, collectively, encompassed approximately half of 12,600 acres that were preserved during the 1980s. Although only 16 of the original dairies are still in operation, much of the acreage they utilized is still used for livestock or forage production. As was noted in a previous section of this report, the diversity of livestock operations is increasing and a recent survey of lands within the APDs showed that 48 percent of FPP land is used for livestock or forage production.

The upsurge of interest in locally produced food and the response of farmers to this expanding market is also reflected on FPP properties. In the 1980's when most of the development rights were purchased, only a few farmers sold directly to consumers. Now, with 32 farmers markets in the county, there are many agricultural operations on FPP properties that sell their products directly to the consumer. In the early 1990's there was one FPP property that was a subscription farm in which the "subscribers" (i.e., the consumers who buy the farm products) pay a fee at the start of each season which then buys them a season's worth of product. Now there are three CSA's operating on FPP property and each of these has several hundred subscribers.

Habitat Projects on FPP Property

In addition their suitability for agricultural use, FPP properties often have high habitat value, both for aquatic and terrestrial species. In recent years, the FPP has had to respond to inquiries as to whether FPP properties can be used for habitat purposes. In responding to these inquiries, policies have been developed that are intended to maintain the county's obligation to preserve these lands for agriculture while at the same time utilizing, to the extent possible, their value as habitat sites. Although the Bond Initiative that enabled the FPP and the FPP covenants both recognize the open space values of the preserved lands, the intent of the FPP is to preserve land for agricultural use. Consequently, suitability for agricultural use must be maintained and any use of preserved farmlands for habitat or open space purposes must not permanently impair the land's ability to support agriculture.

Responding to Change

The Agriculture Commission has been working with county staff to assess and respond to the challenges, changes and opportunities facing farmers. However, farmers whose properties are subject to the FPP's original Deed and Agreement have not been able to take full advantage of some of the changes and opportunities and the commission felt that the Deed and Agreement needed to be updated and revised in order to better promote and protect economically viable agriculture.

Updating King County's Original Agricultural Conservation Easement

In 2005, the original Deed of and Agreement Relating to Development Rights was modified to include requirements imposed by the use of federal funding to purchase farmland development rights. This funding, available through the Farm and Ranch Lands Protection Program administered by the Natural Resources Conservation Service, has become an important source of funding for the FPP. In 2006, the State of Washington initiated a Farmland Preservation Program that made State funding available for purchasing farmland development rights.

The State Farmland Preservation Program also requires that certain restrictions and contractual obligations be included in the easement that is placed on properties on which the development rights have been acquired. In light of this, and because King County's Deed of and Agreement

Relating to Development Rights had not been significantly altered or updated since it was drafted in the early 1980s, FPP staff felt that it was a good time to update the Deed and Agreement and make it more compatible with current agricultural practices and concerns. Staff enlisted the assistance of the King County Agriculture Commission in reworking and updating the covenants.

The Agriculture Commission's Regulatory and Land Use Committee met for approximately two years to discuss and update the FPP covenants. The majority of the Committee's work focused on the following questions and topics:

1. How should agriculture be defined?
1. Should the covenants require that the protected property be actively farmed?
2. How to keep preserved properties affordable by farmers.
3. Should the covenants address water rights?
4. Should there be a limit on the size of dwelling units?
5. Should the covenants allow the processing and marketing of products that are not grown on-site?
6. Criteria for allowing home industries and home occupations
7. Should the covenants allow the consumption of food items?
8. Non-tillable surface restrictions
9. Conversion of farmable areas to habitat uses

Two of these topics were of particular concern to both the committee and the full commission: requiring that the protected property be actively farmed and keeping the protected property affordable for farming. The following paragraphs summarize the discussions of these topics and the Agriculture Commission's recommendations concerning them.

Should the FPP Covenants Require that the Protected Property be Actively Farmed?

Both the Regulatory and Land Use Committee and the Agriculture Commission felt strongly that preserved properties should remain in active agricultural uses. However, there were also strong differences of opinion as to how this goal could be achieved. Ordinance 4341 that enabled the FPP used the definitions in RCW 84.34 to define farmland and open space land. The Committee discussed whether the easement should describe the protected property as specifically meeting the criteria for classification as "Farm and Agricultural Land" as set forth in Section 84.34.020(2) or if the description should also include the criteria stated in Section 84.34.020(8). Using only the criteria specified in Section 84.34.020(2) would require that preserved farmlands be actively farmed. Section 84.34.020(8) expands the criteria to include lands that used to be actively farmed, but which are now classified as "Open Space Land." It also includes other traditional farmlands that are not currently farmed, but which have a high potential for returning to commercial agriculture.

It was argued that since the intent of the FPP is to preserve properties as farmland, the easement should only reference Section 84.34.020(2) and the covenants should only allow agricultural uses. The point was made that since the original easement allows both agricultural and open space uses, FPP lands are being used for "palatial" home sites without using (nor intention to use) the land for commercial agriculture. These home sites are located in the Agricultural Production Districts (APDs) and some Committee members felt that this use violates the intent of the Growth Management Act (GMA) designation of agricultural lands with long term commercial significance and is contrary to the GMA goal to maintain and enhance the agricultural industry. The concern was also expressed that using preserved properties primarily as home sites damages the "critical mass" of commercial agriculture within the Agricultural Production Districts (APDs) and leads to a loss of infrastructure that is critical to the agricultural economy. One member also felt that allowing FPP lands to be used primarily as home sites could be interpreted as a misuse of funds dedicated to the protection and enhancement of agriculture. Requiring that preserved properties remain actively farmed would also help to ensure that the features which make them suitable for agriculture, such as drainage, water availability, etc., are maintained.

The argument to allow other open space uses in addition to agriculture focused on the ability of the county to enforce the covenants. It was argued that, due to circumstances beyond their control, a property owner may not be able to farm themselves or even to lease the property for farming. In instances such as this, requiring that the protected property be actively farmed may be very difficult or even impossible to enforce. This concern was also expressed by the Prosecuting Attorney. The additional point was made that the primary objective of the FPP is to preserve high quality agricultural soils and, although it is desirable to have preserved properties actively farmed, protecting the soil resource should be the requirement rather than active farming.

Instead of stating that the property must be actively farmed, the committee recommended that the new covenants state that “The Grantee strongly encourages the Grantor to farm the protected property or the lease the protected property for farming” so that the Grantor would be aware of what the county wanted. In order to address the very real concern that unfarmed properties may lose their ability to support agriculture, the Committee also recommended that the covenants require that the property be managed under a Farm Management Plan by which the property is maintained in a condition capable of supporting current or future commercially viable agriculture. The Agriculture Commission supported the Committee recommendations to include language stating that farming is strongly encouraged and to require that the property be managed under a Farm Management Plan that would maintain its suitability for agriculture.

Keeping FPP Property Affordable for Farming

One of the main factors affecting property value is the value of the improvements and the Committee discussed limiting improvement value as a means of keeping cost of property down. As was previously noted, several Committee members expressed concern that very large houses were beginning to appear in the APDs. They felt that these large residences were inconsistent with the rural character of APDs and they were concerned that the value of these improvements is so high that the property on which they are located is no longer affordable for farming. The suggestion was made that, as a means of keeping preserved properties affordable, perhaps the covenants should restrict dwelling units to a size that is consistent with other dwelling units in the APD. It was suggested that a reasonable restriction would be a size limit of 150 percent of the median size of dwelling units in all of the APDs. Based on the Assessor’s data, the median size (total living space square footage) of dwelling units in all of the APDs is currently 1,970 sq. ft.; 150 percent of this area is 2,955 sq. ft.

In addition to keeping preserved farmlands affordable, Committee members who supported this suggestion argued that this including restriction would allow the property owner to receive additional compensation for their development rights. They also argued that limiting the size of dwelling units may help to ensure that sufficient non-tillable surface allowance (the covenants restrict non-tillable surfaces to 5 percent of the property area) would be available for agricultural buildings and surfaces.

The Committee also discussed the drawbacks of limiting dwelling size to keep properties affordable. Putting an additional restriction on the property would increase the cost to the county of purchasing development rights. Limiting the size of residences in order to keep properties affordable for farming assumes that only farmers purchase affordable properties; it also makes the assumption that farmers don’t want or need large houses. The opinion was also expressed that it can be beneficial to allow a variety of house sizes and lifestyles as this can result in greater diversity of farmers and farming operations. Additionally, limiting the size of residences on preserved farmlands could be the first step towards limiting the size of residences on all properties within the APDs.

In light of these arguments, the Agriculture Commission recommended that limiting house size should not be required, but instead, that it be included as an option. The Commission also recommended that, on properties which are currently undeveloped, the Grantor be given the option of reserving the right to have no dwelling units. This would allow a Grantor who did not

need a residence to receive additional compensation for his development rights and, because the property could not be used for residential purposes, would help to keep the property value down.

The Regulatory and Land Use Committee kept the Agriculture Commission informed of their proceedings and as the Committee developed its recommendations, they were passed on to the full commission for their review. At the September 11, 2008 meeting the Agriculture Commission approved a motion recommending the adoption of the new agricultural conservation easement.

The new FPP easement, now called the King County Agricultural Conservation Easement: Deed and Agreement Relating to Development Rights was approved for use by the King County Council on October 5, 2009 (Ordinance 16676). It includes the recommendations of the Agriculture Commission and meets the requirement that are imposed by the use funds generated by the 1979 Farmlands and Open Space Bond Initiative, as well as funding from the federal Farm and Ranch Lands Preservation Program and the State Farmland Preservation Program. The new easement will be used for new development rights acquisitions and as an amendment to the existing easement (Deed and Agreement) on properties currently enrolled in the FPP, if all parties agree to the amendment.

History of the Farmland Preservation Program

I. The Bond Initiative

The FPP originated in 1974 when a study on regional agriculture by the Puget Sound Council of Governments documented that urbanization of prime farmland was approaching 3,000 acres per year in King County. Although the county encompasses over 1.4 million acres, only about 100,000 acres have the soil characteristics necessary to be considered prime farmland. Between 1945 and 1974 the acreage of land in farms decreased to less than 58,000 acres and the number of farms in the county declined from almost 6,500 to less than 1,400. The study also found that agriculture was often considered to be an “interim” land use that could be displaced as soon as other uses became available.

King County has long recognized the importance of agriculture as part of the county’s economic and social community. The King County Comprehensive Plan, adopted in 1964, identified certain land areas for continuation in agriculture and stated as a goal the “protection of certain agricultural, flood-plain, forest and mineral resource areas from urban type development.” In 1972 this goal was reinforced with adoption of Ordinance No. 1096 which established a policy that “Class II and III soils having agricultural potential and other classified or unclassified land presently being farmed shall be reserved for current and anticipated needs.”

The Puget Sound Council of Governments report that defined and evaluated agriculture in the Central Puget Sound Region was released in the summer of 1974. The report concluded that maintaining agriculture in an urbanizing area would require both the preservation of prime agricultural land and the promotion of the agricultural use of that land. The adoption of Ordinance No. 1839 implemented the concept of withholding agricultural lands from development to protect their agricultural capability. Unfortunately, this ordinance did not provide sufficient protection and the erosion of the county’s agricultural land base continued. Finally, in December 1975, the County Council adopted a one-year moratorium on further development of farm land until the problem could be studied and a more comprehensive action program initiated.

Ordinance 3064, which was passed by the King County Council in January, 1977, designated eight Agricultural Production Districts and established policies to ensure that as development occurred, the agricultural potential of the Districts would not be adversely affected. The ordinance also designated Agricultural Lands of County Significance and included zoning

policies to ensure that parcels within this designation remained large enough to support commercial agriculture.

In addition to designating agricultural areas, Ordinance 3064 directed the Executive to conduct an analysis of agricultural lands programs and to develop implementation proposals for such programs. A report issued in October, 1977 by the County's Office of Agriculture analyzed factors affecting agricultural economic activity. The report concluded that a combination of land and support programs was necessary to provide a comprehensive approach that would adequately protect and encourage agriculture in the county.

In September, 1978 the County Council passed two ordinances addressing the acquisition of farmland development rights. Ordinance 3871 authorized submitting a \$35 million bond initiative to the voters for the purpose of providing funds for the acquisition of interests in farm and open space land. Ordinance 3872 authorized the use of the bond proceeds to purchase development rights on 10,000 acres as a means of preserving farm and open space lands.

This bond initiative was placed on the November, 1978 ballot and the election recorded 177,984 "yes" votes to 119,912 "no" votes. However, this was 754 votes short of the 60 percent majority necessary for approval of the initiative.

After the election, the County Executive and the Chair of the King County Council convened a citizens' study committee to review the 1978 ballot measure and develop a recommendation on the best way to preserve farm and open space lands. In May, 1979 the citizens' study committee recommended that a \$50 million bond initiative be presented to the voters in the next primary election. Passage of this initiative would enable the purchase of development rights on 13,500 acres of agricultural land in the Snoqualmie, Sammamish and Green River valleys, on the Enumclaw Plateau and on Vashon Island.

In June, 1979, the County Council approved Ordinance 4341 which called for an election to authorize issuing bonds, the proceeds of which would be used to acquire development rights on suitable farmlands. Ordinance 4341 also outlined the criteria for evaluating lands for development rights acquisition and established a citizen selection committee to advise the Council on suitable properties.

The County Council decided to put the new bond initiative before the voters in the September, 1979 primary election. The ballot received the required 60 percent "yes" vote, but the number of votes cast fell short of the number necessary (40 percent of the number voting in the last general election) to validate the bond initiative.

The Farmlands and Open Space Bond Initiative was put back on the ballot for the November 6, 1979 general election. The third time was a charm, as 63.6 percent of the voters approved the initiative and the voter turnout was sufficient to validate the election.

II. Implementation of the Farmland Preservation Program

Implementation of the FPP and the purchase of farmland development rights was delayed by a 1980 State Supreme Court ruling that said the bonds King County issued were limited by the 8 percent interest rate on 30-year municipal bonds that was in effect at the time of the 1979 election. Since the interest rate for AA municipal bonds was close to 12 percent in the early 1980s, the county could not sell any 30-year bonds at the original rate of 8 percent. The bonds that the voters approved in 1979 were to be available for only six years and there was concern that the bond rate may not drop back to 8 percent within this timeframe. In 1982, with just 3 ½ years remaining before the authority to sell bonds expired, the County Executive appointed a citizens' task force to examine financial alternatives and present recommendations on the best means of implementing the FPP.

The citizens' task force made several recommendations, one of which was to authorize the immediate issuance of at least \$10 million in Councilmanic bonds. This recommendation was adopted and although it resulted in a second lawsuit, the county was able to sell \$15 million in Councilmanic bonds. In 1984, funds generated by these bonds were used to purchase development rights on 2,100 acres of farmland in the Sammamish and Green River Valleys and on Vashon Island.

The State Supreme Court made another ruling in 1985, allowing the county to use short-term bonds and to average interest rates, to meet the 8 percent limitation. This ruling allowed the county to issue bonds for the remaining \$35 million so that the FPP was fully funded. Funds from these bonds were used to purchase development rights on farmlands in the Snoqualmie Valley and on the Enumclaw Plateau. The county continued to purchase development rights for the next two years and by 1987, 187 properties totaling 12,658 acres were enrolled in the FPP.

The FPP was audited in 1988 by the County's Office of Internal Audit. The audit recommended that a monitoring program was necessary to ensure the effective preservation of program properties and to ensure the viability of local agriculture. The audit also recommended that preserved properties be identified to staff who review permit and subdivision applications, that information on the condition of the preserved properties be completed, that identified covenant violations be resolved, and the implementation of formalized investment policies and procedures to maximize financial resources for future programs.

Due to a lack of funding for staff for staff time, only the recommendation regarding investment policies and procedures was implemented promptly. The FPP was audited a second time in 1991 and the Auditor again recommended that a formal monitoring program be initiated. The audit also recommended that organization responsibility be fixed for commenting on land use proposals and the Comprehensive Plan, as to their impact on agricultural activities in the county. The audit also recommended that the county consider the feasibility of including certain elements of agricultural marketing/economic support with the agriculture program of the county. The implementation of the last two recommendations is discussed in other sections of this report.

The 1991 audit resulted in the creation of a "Property Rights Specialist" position having the duties of property monitoring, updating and maintaining records, resolving covenant violations and ensuring that permitting staff had access to information regarding the preserved properties. Funding for this position was included in the county's 1992 budget and a Property Rights Specialist began working in July, 1992. Since then the scope of the position has changed to include the other activities described in the "Program Description" section of this report. In recent years, a part-time position has been added to assist with monitoring and record-keeping. It is strongly recommended that this additional staffing be continued as these activities are crucial to the continued success of the FPP.

Sno-Valley Tilth statement on the Future of
Agriculture

Sno Valley Tilth statement on the Future of Agriculture

Sno-Valley Tilth Public Testimony on “The Future of Farming in King County.” March 12, 2009

[Two notes about Sno-Valley’s Tilth’s testimony:

- a. For the sake of readability, we have written this testimony using first-person plural; when we say “we,” we refer to the Board of Directors of Sno-Valley Tilth that has approved this statement.
- b. Our testimony applies only to agriculture as it occurs in designated “Agricultural Production Districts,” or APDs. This is because in creating the APDs, legislative bodies have provided some very specific guidelines about what APDs should be; in areas outside the APDs, we do not see that degree of clear, legislative direction.]

We would like to focus our comments concerning the “future of agriculture” on two questions that emerged from public testimony before the King County Council last summer. The first of these questions stems from contradictory public testimony about what agriculture in King County is. The second question relates to conditions that should apply to the granting of permits for new agricultural structures in our Agricultural Production District floodways.

1. **In the future, what should be considered as “agricultural practices” on King County lands designated as Agricultural Production Districts (or APDs)?**

To clarify the future of agriculture in King County’s APDs, we believe that Council should establish a working definition of what activities should be considered agricultural. We hear a great deal about “preserving agriculture,” “enhancing agriculture,” and “supporting agriculture.” But how can we speak responsibly about the future of agriculture unless we know what we mean by the word “agriculture”? We believe that such a definition is clearly operative in existing State laws and County codes. But confusion still exists, and we urge the Agricultural Commission to recommend to Council that it adopt a clear and explicit definition of agriculture in our designated APDs.

Our recommendation for the specific language of this definition is this: “agriculture is either (1) the commercial production of food and forage products which are grown for the end-use of human consumption, or (2) the commercial production of fiber products.”

Based on this definition, the litmus test as to whether a proposed land-use, in designated King County APDs, is “agricultural or not” would be this: “does this activity generate a product that is being grown commercially (directly or indirectly) for human consumption, or that is grown as a commercial fiber product?” If such a product can be identified, the proposed land-use should be considered agricultural; if such a product cannot be identified, this use should not be considered agriculture.

In support of our vision of the future of farming in King County APDs, we would like to reference the recently published *Future of Farming in Washington* report. This document, with one exception, does not specify any activity deemed “agricultural” that does not meet the criteria of our proposed definition. The one exception is the inclusion of “fuel” as an end-use. Beyond biofuels, every reference to agricultural production in this nearly 100 page document is a reference to land-use activities that fall within our proposed definition of agriculture. This research project was a year-long, well-funded, study, which, of course, was aided by our own Agricultural Commission. Clearly we don’t have to determine that the “Future of Farming in King County” is exactly the same as the “Future of Farming in Washington State.” But in recognizing that our proposed recommendation for a definition of agriculture so closely coincides

with the operative definition of the state-wide study, we see strong validation of the relevance and appropriateness of our proposed definition.

Of more significance are the reasons for the similarity between our proposed definition and the report of the “Future of Farming in Washington State.” Certainly this definition is reflective of the common understanding of what agriculture is. More importantly, however, is that this understanding is supported by clear, abundant, and compelling documentation within Federal, State, and King County Codes, as well as many public ancillary statements and pronouncements. We won’t take time to cite the relevant codes, but we have had an attorney collate some of these documents which we are submitting today to the commission as a written addendum to our public testimony.

At the present time, land uses such as gun ranges, sports fields, equestrian facilities, golf courses, dog kennels (etc.) exist on land designated for agricultural production. Although we do not believe these kinds of land-uses are agricultural, we see these existing facilities to continue on both now and in the future. But we also believe that as we look to the future of agriculture in King County, new endeavors on lands that have been designated specifically for agricultural production should be land-uses that result in the commercial production of agricultural products.

2. What conditions should be applied to new agricultural structures in the APD floodways?

Last summer when the recommendations of the Snoqualmie Valley Flooding and Farming Task Force were presented to Council for approval, we objected to one of the sixteen recommendations—the one that allowed new agricultural accessory structures in the APD floodways.

It will be remembered that the Snoqualmie Valley Flooding and Farming Task Force was initiated by Councilmember Kathy Lambert at the request of members of SVT. It was SVT representatives to this Task Force that introduced and argued persuasively that new accessory, agricultural structures should be allowed in the floodways. So it was extremely difficult and, frankly, awkward, for us to end up having to repeatedly speak in opposition to the ordinance we initiated, we had argued strongly in favor of, and that we wanted so badly.

The reason for our opposition to this ordinance was that we feared (and still fear) that without a clear and operative definition of “agriculture,” new buildings in the future could be constructed to support non-agricultural activities in the floodways of the APDs.

We are thankful that Council responded to our concerns last summer by amending the legislation regarding those structures to a limit of 5000 square feet in size. We are even more thankful that Council has asked the Agricultural Commission to try to sort out these issues, and that the commission has established the process we’re involved in today to find ways to address our concerns.

Our recommendation to the Agricultural Commission regarding new agricultural accessory buildings in the APD floodways is this: First, we ask the Agricultural Commission to recommend that Council adopt our proposed definition of agriculture in the APDs of King County. Second, we ask that, predicated on that definition, the Agricultural Commission recommend further that Council amend the ordinance allowing these structures by adding these words: “the use of all new agricultural accessory structures in the floodways of the APDs be shall be for agricultural purposes.”

If for some reason Council does not adopt a definition of agriculture along the lines of our proposal, that is, if we fall short of a definition of agriculture that states something consistent with “agriculture is either (1) the commercial production of food and forage products which are grown for the end-use of human consumption, or (2) the commercial production of fiber products,” then

we would strongly urge the Agricultural Commission to recommend to Council that it extend the 5000 square foot limit on the size of future agricultural accessory structures in the floodways of the APDs that now expires on January 1, 2010 to January 1, 2012.

This is not a recommendation we make lightly. Farmers desperately need accessory agricultural buildings. But we are neither desperate enough nor short-sighted enough to recommend that agricultural accessory buildings be constructed in our APDs that could serve what we, and most others, believe to be non-agricultural purposes.

It is these non-agricultural land-uses that drive the cost of land up; they have historically displaced existing farming operations, and have inflated land values to the level that land becomes unaffordable for farming. We do not want to have any part in making this happen, and we are willing to scale back our farming operations by imposing this size limit on our own accessory structures, if that is what it takes to prevent new non-agricultural structures from being constructed on APD floodway land.

Conclusion

In conclusion, we want to point out that our understanding of what agriculture should be in the future is not only supported by common understanding, laws and codes at all levels of government, findings of the *Future of Farming in Washington* research project, the only local agricultural organization in King County, and the vast majority of the residents of this County, but we believe it is also the one and only understanding of “Agricultural Production Districts” that is coherent.

What we mean is this: The land in our APDs has been designated to be preserved for agriculture. In naming these lands “Agricultural Production Districts” legislators have, by the very choice of this specific name, said these districts are established for the purpose of “agricultural production”—the name says what it is, and what it’s for. But if we grant agricultural production, then there must be agricultural products.

Each of the non-agricultural uses of land we mentioned earlier—sports fields, dog kennels, horse facilities, golf courses, shooting ranges, etc.—have this in common: none of them produce an “agricultural product.” What agricultural product could possibly be named in any of these worthy, but non-agricultural, endeavors? On the other hand, each of the agricultural uses that fall within our proposed definition of agriculture does have a nameable, agricultural product. Our question is, “how does one make sense of having an ‘Agricultural Production District’ if it doesn’t mean that this area is a ‘district’ in which there is ‘agricultural production’?”

It seems to us that we should either dissolve the APDs, or let them be what they were designed and named to be—places that commercially produce agricultural products. What we should not do is alter the unquestionable intent of the legislators who established our APDs.

We want to conclude our testimony by reiterating that our proposal regarding an operative definition of agriculture has no bearing on endeavors that now occur in designated APDs—whether they are agricultural or not. Our proposal is most certainly not a suggestion about closing down any *existing* activities in our APDs, now or ever. Our recommendations look to the “future of agriculture,” which is what the Agricultural Commission has enjoined us to do.

We also want to emphasize that our recommendations regarding agricultural accessory buildings are only relevant to lands within those areas of designated APDs that are also designated as FEMA “floodways.” Our recommendation regarding agricultural accessory buildings has no bearing, for example, in the majority of the Enumclaw APD, which lies outside the FEMA floodway, nor has it any bearing in other APD lands that are not in the FEMA floodway.

Summary of actions requested by SVT

We are asking that the Agriculture Commission recommend:

1. That Council adopt a working definition of agriculture that uses (or is consistent with) the following language: “agriculture is either (1) the commercial production of food and forage products which are grown for the end-use of human consumption, or (2) the commercial production of fiber products.”
2. That assuming Council adopts a definition of agriculture consistent with our proposal, Council should also amend the current ordinance allowing agricultural accessory structures in the FEMA floodways of APDs to say “the use of all new agricultural accessory structures in the floodways of the APDs shall be for agricultural purposes.”
3. That in the absence of a working definition of agriculture similar or consistent with #1 above, Council amend the current ordinance allowing agricultural accessory structures in the FEMA floodways of the APDs to extend the 5000 square foot limit on agricultural accessory structures in the floodways of APDs for two more years, until January 1 of 2012.

Defining of Agriculture in King County – Snoqualmie Valley Tilth

1. Goals

- Snoqualmie Valley Tilth requests that the King County Council define agriculture as the production of food, forage, or fiber for end-use human consumption.
- Snoqualmie Valley Tilth requests that the King County Council ensure that “agricultural accessory structures” are only permitted when the structure is directly related to the production of food, forage, or fiber for end-use human consumption.

2. Synopsis

- Washington State and King County law imply that agriculture is defined as the production of food, forage, or fiber for end-use human consumption.
- Because this definition is only implied, it is subject to interpretation by state and county agencies. Snoqualmie Valley Tilth believes that state and county agencies currently include many non-agricultural uses in their interpretation of agriculture in contravention of the intent of laws and regulations such as the Growth Management Act and the 2006 King County Comprehensive Plan.
- It is the position of Snoqualmie Valley Tilth that agriculture in King County should be specifically defined as the production of food, forage, or fiber for end-use human consumption.
- By creating a specific legal definition of agriculture, the County will help achieve the goals of past legislation, including the 2006 Comprehensive Plan, by specifically limiting new construction in the Agriculture Production Districts to structures specifically intended to assist in agriculture production.

3. Why is it important to define agriculture?

Late in 2008, the Washington State Department of Revenue passed an emergency rule intended to address discrepancies in its assessment of what qualifies as “farm and agricultural use” land. WAC 458-30-200. Specific to this question was whether hobby equestrian operations qualify as an agricultural use. The Department of Revenue concluded that because hay sold off the farm is an agricultural product, equestrian operations that board and pasture horses are selling an agricultural product, per RCW 84.34.020(2), i.e. living grass. Horse farms that either

do not board horses or do not pasture boarded horses do not qualify.¹ This interpretation by the Department of Revenue seems to comport with State laws regulating agriculture. However, the effect of such an interpretation may prove disastrous to food production in the Agricultural Production Districts. It also goes against the clear legislative intent of the state Growth Management Act as well as the King County Comprehensive Plan.

What worries Snoqualmie Valley Tilth is that code changes enacted to help farmers and encourage farming in King County will have the unintended consequence of creating loopholes that will lead to the construction of non-farming related structures and homes. In the opinion of Snoqualmie Valley Tilth, the most effective way to ensure that APDs like the Snoqualmie Valley maintain their agricultural character is to create a strict legal definition of agriculture. In this way, the County can be sure that all laws and codes enacted to promote farming will have the intended effect.

Currently, there is no legal definition of “agriculture” in King County or in the State of Washington. Legislative vagueness often results in unintended consequences and improper or inconsistent enforcement of the law. A brief tour of the Snoqualmie Valley Agricultural Production District will reveal that the incredibly rich, prime agricultural soil of the valley is being put to a variety of uses that are neither agricultural nor production. There are two golf courses, dozens of equestrian operations, shooting clubs, and sports fields. Snoqualmie Valley Tilth is not asking the County to retroactively prohibit these current uses. However, if the County is serious about ensuring that agricultural production occurs in the Agricultural Production District, more safeguards are required to ensure that these rich resource lands are put to their most productive use.

Permitting non-farming uses in agricultural production districts, ultimately, has the effect of driving farmers out of the APDs. See e.g. KCC 26.04.010(E) and (F). See also *Van Buren v. Miller*, 22 Wn. App. 836, 837, 592 P.2d 671 (1979) (“The purpose of chapter 84.34 RCW is to encourage owners to retain their land for farm use and to resist the trend to sell agricultural land for urban subdivision.”) It is the opinion of Snoqualmie Valley Tilth that a clear definition of agriculture should ensure that all new construction in the APD is strictly limited to structures that are directly related the production of agricultural products. To allow structures intended for purposes other than agricultural production in the Agricultural Production District will have the effect of driving agricultural production out of the APD entirely, replacing it with equestrian estates and other non-farm related uses.

4. The political environment today supports a strict definition of agriculture

It is the expressly stated policy of the state of Washington and King County to protect, preserve and enhance agricultural and open space lands. This policy is clearly spelled out in laws and ordinances such as the King County comprehensive plan of 1964, as amended by Ordinance 1096, establishing open space policies in King County; RCW Chapter 84.34 and Ordinance 2537, authorizing current use taxation of agricultural and open space land; Chapter 84 Laws of 1979 limiting and deferring road and utility assessments on farm land and open space land; Ordinance 3064, as amended, establishing King County's agricultural lands policy and county and city ordinances regulating land use by zoning; and the 2006 King County Comprehensive Plan. As the County Council wrote in its 2006 King County Comprehensive Plan:

“with the county’s emphasis on preserving agricultural and

¹ See

<http://dor.wa.gov/Content/GetAFormOrPublication/PublicationBySubject/TaxTopics/WAC458RuleChange.aspx> (last visited March 10, 2009).

forestry lands within the Agricultural and Forest Productions Districts, the development of large equestrian facilities of a size and scale that would be incompatible with agricultural and forestry practices within these districts should be discouraged.”

2006 King County Comprehensive Plan Ch. 3 pg. 13.

These State and County laws reflect the growing demand in the region for healthy, non-toxic, locally produced food. For instance, KCC 26.04.010(C), “Acquisition of Interests”, lists protection of farmland used for growing food as its primary purpose in its declaration of intent.

Unfortunately, there are not enough farms in the area to meet current demand. The good news is that, as a result of effective open-space preservation programs, there is a good deal of potentially farmable land in the County. Likewise, due to an increasing interest in low-impact, non-toxic farming, there is also a surplus of potential farmers who, given the opportunity, could help meet our burgeoning regional demand for locally produced food. Unfortunately, much of the potential farmland in our County is un-farmable because current zoning laws and building codes prohibit or inhibit the construction of farming necessities such as barns, worker housing, accessory buildings, and wells.

5. There is an implied legal definition of agriculture in Washington State

The Merriam-Webster Dictionary defines “agriculture” as: “the science, art, or practice of cultivating the soil, producing crops, and raising livestock and in varying degrees the preparation and marketing of the resulting products.” While there is no specific legal definition of agriculture at either the county or state level, state and county laws regulating farming reflect this dictionary definition. Viewed as a whole, state and county laws regulating agriculture are clearly based on the premise that producing and selling agricultural products are what constitutes agriculture. That is to say, “agriculture” is composed of two specific elements – (1) raising a crop, animal, or product derived thereof and (2) selling that crop, animal, or product.

For instance, under RCW 82.04.213(1), an “agricultural product” is defined, in relevant part, as “any product of plant cultivation or animal husbandry.” RCW 82.04.213(2) goes on to define “farmer” as “any person engaged in the business of growing, raising, or producing... any agricultural product *to be sold*.” King County code 12.87.040 mirrors this State law, defining “commercial agriculture” as the production of livestock or agricultural commodities on agricultural lands and the offering of the livestock and agricultural commodities for *sale*. Under RCW 7.48.310(1), the “Right-to-Farm law,” an “agricultural activity” is “a condition or activity which occurs on a farm in connection with the *commercial production of farm products*.”

Likewise, RCW 84.34.020(2) “Farm and Agricultural Land” defines “agricultural land” as land that is “devoted primarily to the *production* of livestock or agricultural commodities for commercial purposes.” King County Code 21A.04.030, “Agricultural Zone”, also closely mirrors the state definition of agricultural land. KCC 21A.04.030(2) permits “uses related to agricultural *production*” and “limit(s) nonagricultural uses to those compatible with farming or requiring close proximity for the support of agriculture.”

The Growth Management Act also defines agricultural land. The GMA defines agricultural land as “land primarily devoted to the *commercial production* of horticultural, viticultural, floricultural, dairy, apiary, vegetable, or animal products or of berries, grain, hay, straw, turf, seed, Christmas trees . . . or livestock, and that has long-term commercial significance for agricultural production.” RCW 36.70A.030(2). Under the GMA, the legislature established that agricultural lands are those which (1) are “primarily devoted to” commercial agricultural production and (2) have “long-term commercial significance” for such production. RCW

36.70A.030 (2). The Supreme Court addressed the meaning of the term "primarily devoted to" in *City of Redmond v. Central Puget Sound Growth Management Hearings Board*, 136 Wn.2d 38, 959 P.2d 1091 (1998), a case in which landowners challenged designation of their land as agricultural. In that case, the court held that land is primarily "devoted to" commercial agricultural production "if it is in an area where the land is actually used or capable of being used for agricultural production." *Id.* at 53. The court went on to say that that a landowner's intended use of the land is irrelevant. *Id.* What this means is that the characteristics of the land, i.e. soil quality, location, topography, etc., are most important in determining its appropriate uses.

In *Lewis County v. W. Wash. Growth Mgmt. Hearings Bd.* 502²157 Wn. 2d. 488 (2006), the Supreme Court addressed the meaning of the term "long-term commercial significance." In that case, the Court held that "agricultural land is land: (a) not already characterized by urban growth (b) that is primarily devoted to the commercial production of agricultural products enumerated in RCW 36.70A.030(2), including land in areas used or capable of being used for production based on land characteristics, and (c) that has long-term commercial significance for agricultural production, as indicated by soil, growing capacity, productivity, and whether it is near population areas or vulnerable to more intense uses. *Id.* at 497.

The product-based definition of agriculture suggested by the complex web of state and county laws is also reflected in federal law. The Fair Labor Standards Act defines agriculture in this way. The FLSA provides in pertinent part: "Agriculture" includes farming in all its branches and among other things includes the cultivation and tillage of the soil, dairying, and production, cultivation, growing and harvesting of any agricultural or horticultural commodities ... and any practices ... performed by a farmer or on a farm as an incident to or in conjunction with such farming operations... 29 U.S.C. Sec. 203(f).

6. Conclusion

Local and sustainable farming today is hailed as the solution to many of today's environmental, health, and sociological problems. Yet it is also under threat from many sides – development, land use laws, flooding, climate change. Foremost is reality that farm income is not necessarily sufficient to carry the mortgage on prime agricultural land when demand for farmland increases among those who earn more money than farmers. Many state and local statutes and codes have addressed this issue by both increasing farm income through incentive programs and by reducing demand for prime agricultural land through zoning restrictions. The creation of the Snoqualmie Valley Agricultural Production District is one such zoning change enacted for the purpose of preserving farmland.

King County is devoting a good deal of energy to preserving farmland in Snoqualmie Valley Agricultural Production District in particular and promoting local and sustainable farming. Snoqualmie Valley Tilth shares this goal. Unfortunately, it is the opinion of Snoqualmie Valley Tilth that certain vagaries in the code as it exists may have the unintended consequence of encouraging non-farming land use in the Agricultural Production District and pushing out those who are engaging in actual agricultural production.

Specifically, the County Council has recently passed a code change allowing for 5000 square-foot "agricultural accessory buildings." Snoqualmie Valley Tilth worries that, in light of a recent Department of Revenue decision interpreting pasturing horses as agriculture, the Council's recent code change will allow landowners in the APD to build non-farming related structures and thereby raise demand for land in the APD among people who will not farm. For this reason, the Snoqualmie Valley Tilth encourages the King County Council to enact legislation that defines agriculture such that all future legislation intended to promote agriculture in the APD has the intended effect. To that end, Snoqualmie Valley Tilth suggests that agriculture be defined as the production of food, forage, or fiber for end-use human consumption

Appendix L.

King County Agriculture Programs

2009 FARMS Report Appendix L

King County Agriculture Program

•**Livestock Program** – This program supports the raising and keeping of livestock in the county in an environmentally sound manner. Provides technical assistance on compliance with the county’s Livestock Management Ordinance: manure management, stream and wetland setbacks; livestock densities, and clean water diversion. The Livestock Program includes cost-share assistance for implementing best management practices with a farm management plan.

•**Agricultural Drainage Assistance Program (ADAP)** – ADAP provides technical and financial assistance to farmers to help them maintain agricultural watercourses to improve drainage of fields while preserving water quality and avoiding harmful effects to fish.

•**Farmland Preservation Program (FPP)** –The FPP began in 1979 when voters approved a \$50 million bond initiative which has permanently protected over 13,000 acres of prime county farmlands. Property owners voluntarily sell development rights and agree to covenants that restrict their land use to agriculture or open space and that limit housing density. The county holds the development rights in trust on behalf of the citizens. The program monitors compliance with the covenants, reviews permits and other proposed activities, and continues to secure grant funding to add to the acreage protected.

•**Agriculture Commission** – The Agriculture Program provides assistance to the Agriculture Commission, which advises county staff, the Council and Executive on topics related to agriculture. The Agriculture Program staff members plan and organize meetings, identify and research issues, and assist the commission in communicating their decisions and implementing their annual work program.

•**Agriculture Permit Team** – The Department of Development and Environmental Services (DDES) sponsors an inter-departmental, interagency team that reviews county code and policy as it affects farmers. In addition to DDES, the team includes Public Health, the Agriculture Program, and the King Conservation District. The team addresses individual permit and code enforcement cases and makes recommendation for improvements in the permitting process and regulations so that they are more agriculture-friendly.

•**Puget Sound Fresh** – King County initiated Puget Sound Fresh in 1997 to encourage consumers and businesses to purchase products grown in the 12 counties that touch Puget Sound. The county has since transferred the program to Cascade Harvest Coalition. Agriculture Program staff continue to manage the website and participate in the program’s marketing activities. King County is the primary financial supporter of the program.

•**Farmers Market Support** – Staff consult with groups starting new farmers markets, work with market managers on best practices, management issues, business operations, and Health Department coordination, and identify opportunities to work together (such as cooperative marketing efforts).

•**Economic Development** – The Agriculture Program staff participate in a number of groups that support the economic viability of farming through the development of farming infrastructure, improving access to markets, providing education to farmers, and helping new farmers get started.

•**Farmbudsman Activities** – Staff provide direct assistance to farmers on land use, building, fire, road, and health code issues, on technical permit questions; on flood recovery, poor drainage, debris slides, impacts from neighboring businesses and residents, requests for conservation easements, etc. Staff work with other agencies to implement balanced solutions for farmers to meet codes and resolve enforcement cases.

• **Land Use Policy** – Staff participate in the County’s Comprehensive planning to ensure that Agricultural land use is protected. Activities include reviewing development proposals, easements, and condemnations related to the designated Agricultural Production Districts and the FPP and encouraging appropriate action. Staff negotiate resolution of the many controversies between agriculture and other mandates; such as fish, floods, transportation, wetland mitigation, value added infrastructure, direct marketing, and health regulations.

Postcard of meeting notice

The King County Agriculture Commission invites your ideas for the FARMS Study

*F*uture of *A*griculture: *R*ealize *M*eaningful *S*olutions

What we are doing

The King County Agriculture Commission has been asked to report on the future of agriculture in the county. In order to do this we need your help.

We invite your opinions and ideas:

- Attend any of the meetings listed on the other side.
- Give us your input online at www.kingcounty.gov/wlr.
- Contact Steve Evans at steve.evans@kingcounty.gov.

We would like to discuss

1. What do you grow or raise?
2. How is your farm operation changing?
3. What kinds of resources or services do you need to be a successful farmer in the future?
4. What are the trends you think are important to your operation and your industry?
5. What are your plans for your farm property in the future?

The King County Agriculture Commission invites your ideas for the **FARMS** Study

Future of **A**griculture: **R**ealize **M**eaningful **S**olutions

You are invited to attend any of these meetings

Jan. 8, 2009 7 p.m. – 9 p.m.
**Carol Edwards Center,
Madrona Room**
17401 - 133rd Ave NE, Woodinville

Feb. 12, 2009 7 p.m. – 9 p.m.
**Auburn City Hall Council
Chambers (1st floor)**
25 West Main St, Auburn

Jan. 22, 2009 7 p.m. – 9 p.m.
**Carnation Elementary
Multi Purpose Room**
4950 Tolt Ave, Carnation

Mar. 12, 2009 7 p.m. – 9 p.m.
Enumclaw High School - Commons
226 Semanski St S, Enumclaw

For more information and other ways to share your ideas

For questions contact

Appendix N.

Agriculture Friendly Regulations

2009 FARMS Report Appendix N

Regulations

Accomplishments

Since its inception, the Agriculture Commission has advised King County on regulatory issues that affect commercial agriculture. The county has made significant progress on addressing many of the issues raised by the commission and other members of the agricultural community. As a result of this work, commercial agriculture has benefited from many regulatory changes, including:

- The Livestock Management Ordinance
- Allowing agricultural ditches to be maintained without a county grading permit
- Allowing wineries on Agricultural-zoned properties
- Flexibility in reducing critical areas buffers for agricultural developments
- Additional opportunities for on-site sales, processing, and storage of agricultural products
- Demonstration Ordinance to allow farm pads
- Allowing agricultural accessory structures in the floodway.

In addition to regulatory changes, the county has offered cost-share incentives and technical assistance for implementation of farm plan Best Management Practices and meeting the regulatory requirements for drainage maintenance and farm pad construction. Recognizing that permit fees were a challenge to many farmers, the county capped the cost of clearing and grading and land use permits for farmers and reduced the lower hourly permit fee for agricultural buildings.

In 2005, the Department of Development and Environmental Services (DDES) took additional measures to address the frustrations many rural residents, including farmers, faced in obtaining permits or responding to code enforcement complaints. DDES began to offer two free hours of technical assistance at the beginning of each day to respond to inquiries from rural residents about zoning, critical area, clearing and grading, and stormwater regulations. They hired a Rural Permit Coordinator to serve as a single point of contact for rural applicants and assigned two ecologists from the critical areas staff to provide free technical assistance. These outreach staff have worked closely with King Conservation District (KCD) staff in implementing the flexibility provided in the Critical Areas Ordinance for buffer reductions. This effort has proven successful in helping farmers. One of the ecologist positions has been eliminated in the 2010 budget, but DDES continues its efforts to provide assistance to farmers and other rural applicants.

At the end of 2006, with the support of the KCD and the Agricultural Commission, DDES convened an Interagency Agricultural Permit Team. The team was composed of staff from DDES, KCD, the Health Department, and the Agriculture Program. Staff from Rural Economic Development and other programs in the Department of Natural Resources and Parks also participate. The Agricultural Permit Team has enabled DDES to work collaboratively with other agencies to resolve permitting and enforcement issues.

An important component of the permit team's work has been getting information out to the public. The Agriculture Commission and the KCD co-sponsored and facilitated permit and flood preparation workshops in the Agricultural Production Districts (APDs). DDES staff held workshops for Vashon-Maury Island and equestrian owners. DDES also published a Technical Assistance Bulletin on agricultural permits.

The team continues to discuss regulations and policies that are difficult to implement. These include those regulating development on alluvial fans, fire code requirements for barns, siting of farm pads, and enforcement related to horse washing facilities. Another measure under consideration by DDES is the development of an Agricultural Commercial Building permit process. The permit team is also working on the difficult task of integrating state, federal, and local permits.

Regulatory Issues Identified by the Agriculture Commission

The Agriculture Commission has created a list of regulatory issues based on input from farmers, rural land owners, stakeholders, and commissioners over the years. The priority was established by the Agriculture Commission, based on what they heard at the FARMS public meetings.

Although many of the issues are addressed in the *FARMS Report*, the list has not been evaluated by King County to determine if particular issues are valid or require regulatory changes. The issues included in the list were chosen by the Agriculture Commission alone, without endorsement by King County.

Protecting the APDs and Farming in the APDs

High Priority:

- Drainage from upslope development onto the APDs
- The effects of flooding in the APDs
- Streamlined ADAP (Agricultural Drainage Assistance Program)
- Alluvial fan deposition below areas that are cleared and developed
- Low-cost remediation of debris slides on alluvial fans
- Planting of farmland as mitigation for buildings or other infrastructure in “grazed wet meadows”
- Production for food and fiber through regulations and incentives, including finding and using mechanisms that discourage or prevent residential estate development on farm land
- Barriers for managing water
- Dredging of the Tolt River Fan and gravel bars in the river to increase its capacity and reduce the likelihood of flooding
- Voluntary enhancement of habitat areas in the APDs

Lower Priority

- Reservoirs upslope of farms to reduce the amount of water flowing down streams into the APD in order “to take top off floods”
- Prevention of direct discharges to the river from large developments in the Snoqualmie

Ag Friendly Regulations for Farmers

High Priority

- Farmworker housing
- Farm pads large enough to accommodate future expansion of the agricultural operation
- Redefine wastewater/sewage from on-farm processing so that it can be used for irrigation and not be considered “industrial wastewater”
- Milking parlors and other farm infrastructure on farm pads
- Beavers and removal of beaver dams that are causing drainage problems

Medium Priority

- Compensatory storage restrictions on farm access roads, manure bins, and other farm infrastructure in the floodplain
- Protection from damage caused by coyotes, deer, elk and other animals

Lower Priority

- The 200 square foot limit of agricultural structures that can be constructed without obtaining a permit
- Permitting requirements for animal waste containment
- Size of manure storage facilities allowed without a permit

- Replacement of old houses in a floodway without the rule that it must be done within a year of the house being destroyed
- Restrictions to wells
- Allow existing septic systems to remain within the floodplain by revising the approach to “repair” versus “new” systems
- Fire code and temporary labor thresholds that require expensive sprinkler systems
- Health code regulations regarding public use of farms for activities such as education and ecotourism
- Limitations on sewer hookups in APDs

How the Regulations are Applied

- Continue the work programs of the Rural Coordinator, CAO assistance, and Agriculture Permit Team to improve agriculture-appropriate permit process and code compliance resolution
- Time, process, and cost required to obtain necessary agricultural permits
- Cost of residential permits for operating farms
- A less compartmentalized agricultural permit track that does not treat infrastructure on an existing farm as “new development,” including a permit for agricultural buildings.
- Work with the Army Corps of Engineers to reduce the time it takes to obtain permits
- Alternative building materials for some small agricultural structures

Rural Economic Strategies

Summary / Rural Economic Strategies / Foundation and Agriculture Cluster Strategies and Actions / Oct. 2009

RES NUMBER	COMP PLAN POLICY	STRATEGY	ACTIONS [to be implemented by OSPPM, BRED, and/or the RES Coordinator]
RES MISSION: Sustain and enhance the long-term economic viability of the Rural Area and Natural Resource Lands.			
		RES Goal 1: Support the diversity and richness of the rural economy by effectively engaging farmers, foresters, rural business owners, rural communities, and rural related organizations in an on-going dialogue.	
		RES Goal 2: Implement the intent and policies of the King County Comprehensive Plan to support a sustainable and vibrant rural economy.	
		RES Goal 3: Promote opportunities for rural residents to both live and work in the rural area.	
Foundation Strategies			
RES-FS1	ED-501, R-102	County Department Application: County departments recognize the importance of sustaining the rural economy and consider the applicable Rural Economic Strategies during development and implementation of their respective strategic plans, policies, and programs.	Continue to coordinate with county departments to ensure that existing and new policies, programs, and projects address and are responsive to rural needs, by participating on interdepartmental policy and project teams and departmental and/or county-wide strategic planning efforts.
RES-FS2	ED-501	Advocacy: Function as an advocate for, liaison with, and technical specialist to ensure that the interests of the rural economy are considered during policy, program, and regulatory development at all levels of government and by rural related organizations throughout the county and Puget Sound Region.	Continue to ensure that the interests and needs of the rural economy are represented in meetings and when reviewing documents regarding policy, program development, and regulatory review and or changes, by continuing to respond to rural issues and coordinating with both internal and external groups and organizations.

RES-FS3	ED-503(b), R-206, R-209, R-211	Policy and Regulatory Support: Ensure existing and proposed changes to county policy and regulations are written and implemented to provide the flexibility needed to sustain the economic vibrancy of rural businesses.	Continue to coordinate with county departments, particularly DDES, DNRP, the Agriculture and Rural Forest Commissions, and rural Unincorporated Area Councils, to ensure that existing and new policies and regulations are responsive to rural business needs, by 1) monitoring and evaluating rural economic impacts of proposed policy and regulatory changes, 2) ensuring rural involvement in the review of applicable proposed changes, and 3) initiating internal discussions of possible changes based on rural concerns and/or input.
RES-FS4	ED-503, R-102	Communication: Promote effective communication and maintain an on-going dialogue with rural residents, businesses and related organizations to exchange ideas, inform, and facilitate solutions to identified needs, issues, or concerns in the rural area.	Continue outreach to and dialogue with rural residents by 1) attending rural related organization meetings, 2) providing input for informational newsletters and the rural services website, and 3) responding to requests for information.
RES-FS5	ED-503(b), R-101	Partnerships: Continue, strengthen existing, and initiate new collaborations when necessary to encourage resource-based and compatible economic development in rural areas of the county and the Puget Sound Region.	Continue to participate in partnerships with individuals and organizations that support or enhance the viability of the rural economy.
	ED-503(c), R-101, R-603	1) Agriculture and Rural Forest Commissions and the rural Unincorporated Area Councils.	Continue to work with and support the programs and projects related to the enhancement of the rural economy by coordinating with county recognized commissions and councils.

	ED-107, ED-401, R-102	2) Rural communities, cities, and organizations that represent or impact on rural area interests (especially in areas not represented by an unincorporated area council).	Continue to work with and support the programs and projects related to the enhancement of the rural economy by organizations and entities within the county by 1) continuing to initiate contact, 2) raising rural issues with appropriate groups, and 3) partnering on economic enhancement projects.
	ED-106, ED-402, R-201, R-204, R-214	3) Puget Sound counties and regional organizations.	Continue to work with and support the programs and projects related to the enhancement of the rural economy in adjacent counties and throughout Puget Sound by 1) continuing to initiate contact, 2) raising rural issues with appropriate groups, and 3) partnering on economic enhancement projects.
RES-FS6	ED-201	Business and Technical Assistance: Strengthen existing and initiate new collaborations with professional organizations to provide rural businesses with business and technical assistance, resources, training, and networking opportunities.	Continue to explore and participate in opportunities to coordinate with local and regional efforts to provide business assistance, training, and networking venues for rural businesses by 1) continuing to initiate contact, 2) raising rural business needs with appropriate organizations, and 3) partnering on business assistance projects.
RES-FS7	ED-503(b), R-206, R-207, R-209	Incentives: Ensure rural residents and businesses are knowledgeable about and have access to grants, low-interest loans, tax, and other incentives that encourage agriculture, forest-based, compatible rural business development, and historic property redevelopment, consistent with rural character and the relevant policies.	Continue to explore and participate in evaluating existing and proposed incentives that will support rural businesses, by 1) leading an interdepartmental effort to identify countywide and regional incentives, 2) providing this information to rural businesses, and 3) continuing to solicit rural input on needs and ensuring incentive opportunities are explored by the proper entities.

RES-FS8		Performance Management: Identify and track rural indicators and trends to help direct policies, the rural economic strategies, and implementation actions that support and/or enhance the rural economy.	Continue to identify, develop, and monitor rural indicators and trends that will support development of county policies and the rural economic strategies as well as implementation actions to support the rural economy, by 1) leading an effort to identify measurable rural indicators, 2) soliciting input on the indicators from the rural area, 3) developing an indicator and trends report by the end of 2010, and 4) continuing to monitor the indicators to ensure that county policies and the rural economic strategies are responsive to changes in rural economic trends.
RES-FS9	ED-503	RES Flexibility & Responsiveness: Address changing rural business needs and guide future economic development by modifying and/or adding strategies and implementation actions as needed to reflect the evolving nature of the rural economy.	Continue to respond to evolving rural business needs by 1) exploring options for solutions to the identified needs and 2) adding or modifying strategies and action items as appropriate.
Rural Economic Cluster Strategies			
RES-AG		AGRICULTURE	
		Purpose: Strengthen and enhance the agriculture cluster - raising of crops and livestock and production of value-added goods - in both the Rural Area and the Agricultural Production Districts.	

RES-AG1	Chapter 3, Section VI(C), ED- 501, R-204, R-205	Retain the agricultural land base of King County and strengthen the policy, regulatory, and business environment to sustain and enhance the businesses that comprise the agricultural cluster.	Continue to support and partner with the DNRP Agricultural Program, Agriculture Commission, and non-profit organizations, such as the Cascade Harvest Coalition, whose goals are related to the support and enhancement of agriculture in the county, by 1) attending meetings as an advocate for and specialist on the rural economy, 2) reviewing draft documents, and 3) providing support for agriculture related economic enhancement projects.
RES-AG2	Chapter 3, Section VI(C), ED- 503, R-204, R-205,	Assist implementation of the Agriculture Commission's annual work plans and its recommendations for priority actions to retain and conserve agricultural lands for agriculture and enhance agricultural production.	Continue to support the activities of the Commission and partner with DNRP Agriculture Program staff on projects that influence or have a direct impact on the economic health of the agricultural economic cluster, by 1) attending key Commission meetings, 2) reviewing planning documents, 3) assisting in developing revised agriculture regulations to provide more flexibility for the cluster, based, in part, on the recommendations of the FARMS Report that the Commission will send to Council in late 2009.
RES-AG3	Ed-503, R- 656	Support and partner with programs that provide business and technical assistance to businesses within the agriculture cluster.	Continue to support and partner with the DNRP Agriculture Program and other organizations whose goals support agricultural business and technical assistance, by 1) attending meetings as an advocate for and specialist on the rural economy, 2) reviewing draft documents, and 3) providing economic technical assistance.

RES-AG4	ED-503, R-657, R-658, R-659, R-660, R-661	Support and partner with programs that promote marketing and market development for agricultural products and value-added goods.	Continue to support and partner with the DNRP Agriculture Program and other organizations whose goals are related to the marketing of value-added agricultural products, by 1) attending meetings as an advocate for and specialist on the rural economy, 2) reviewing draft documents, and 3) providing economic technical assistance.
RES-AG5	ED-503, R-204, R-659, R-668, R-669, R-670	Solicit and respond to identified needs of the agriculture cluster and its required infrastructure to formulate policy and regulatory changes to ensure sustainable and economically viable agricultural practices.	Continue to review county policies and regulations relating to agriculture, by 1) exploring solutions to agricultural issues raised, 2) reviewing new and existing policies and regulations, and 3) promoting and ensuring rural input on proposed regulatory changes.
RES-AG6	R-656, R-657	Support and partner with programs that provide assistance to new farmers with a focus on minorities, low-income, and immigrants.	Continue to support and partner with the DNRP Agriculture Program and other organizations whose goals support providing agricultural business and technical assistance to minorities, low-income, and immigrants, by 1) attending meetings as an advocate for and specialist on the rural economy, 2) reviewing draft documents, and 3) providing economic technical assistance.

RES-AG7	ED-501, R-661	Solicit partners and support businesses or programs conducting efforts to develop secondary markets for added farm revenue, including but not limited to biofuels, manure digester systems, and agri-tourism.	Continue to support and partner with the DNRP Agriculture, green programs, and other organizations whose goals support businesses such as biofuels, manure digesters and agri-tourism, by 1) continuing to initiate contact with potential partners, 2) attending meetings as an advocate for and specialist on the rural economy, 3) reviewing draft documents, and 4) providing economic technical assistance.
RES-AG8	R-672, R-673, R-674, R-675	Educate and promote the importance of buying local produce and value-added products to all county residents and businesses.	Continue to partner with programs and projects, such as Puget Sound Fresh, that support the rural/urban interface, by 1) educating county residents about the county's agricultural base and products, 2) exploring opportunities to promote this message, 3) attending meetings as an advocate for and specialist on the rural economy, 4) reviewing draft documents, and 5) making presentations on and providing information on the rural economy.
